MR. JOHNSON:

Good morning, and welcome to the Pennsylvania Insurance Department's public informational hearing on the transaction involving the application for acquisition or control by Armor Group Holdings, Limited through its subsidiary, Trebuchet U.S. Holdings, Inc., of OneBeacon Insurance Company, Potomac Insurance Company, OneBeacon America Insurance Company and the Employers' Fire Insurance Company, all of which are Pennsylvania Domestic Stock Casualty Insurance Companies.

My name is Steve Johnson and I serve as Deputy Insurance Commissioner for the Office of Corporate and Financial Regulation. I'm responsible for licensing and financial oversight, including onsite financial examination of approximately 275 domestic insurance companies and 4,100 non-domestic insurance companies and 230 continuing care retirement communities. In addition, as Deputy Insurance Commissioner, I'm responsible with the able assistance of my staff, for the review of all corporate transactions involving Pennsylvania domestic insurance companies. And I will assist Commissioner Considine

1 to enable him to make a decision on the filing.

2 I would like to introduce the members of  
3 the Department staff responsible for reviewing the  
4 file. Kim Rankin, my Director of Company Licensing  
5 and Financial Analysis. In the back at the  
6 registration desk, Steve Yerger, Company Licensing  
7 Specialist. Amy Daubert, my Deputy Chief Counsel.  
8 And Jodi Frantz, who's in the back of the registration  
9 desk, is also Department Counsel in the filing.

10 I'd like to welcome and introduce the  
11 individuals from Risk & Regulatory Consulting, LLC,  
12 the Department's expert who has been retained pursuant  
13 to the Insurance Holding Companies Act, Craig Moore.  
14 Okay. Craig's here. Mike Dubin at the table, and  
15 then in the audience here, Anne Kelly and Pat Tracy.  
16 Additionally, the Department has retained outside  
17 Counsel to assist in the review of this transaction.  
18 With us today from the Law Firm of Drinker, Biddle and  
19 Reath, LLP, are Dan Krane, Alicia Hickok and Sandra  
20 Miller, who's out in the audience.

21 By way of background, the Department's  
22 review process began in February 2013 with an initial  
23 application filed pursuant to Section 1402 of the  
24 Holding Company Act. This application is commonly  
25 known as a Form A Filing. The Department published

1 notice of the filing in the Pennsylvania Bulletin in  
2 February 23rd, 2013. The notice invited interested  
3 parties and persons to provide comment to the  
4 Department about the filing. The Department received  
5 a number of public comments, all of which are  
6 available on the Department's website at  
7 [www.insurance.pa.gov](http://www.insurance.pa.gov).

8           The filing was amended twice on June  
9 19th of 2014 and on June 25th, 2014, to include  
10 OneBeacon America Insurance Company and the Employers'  
11 Fire Insurance Company, who just completed their  
12 re-domestication from Massachusetts to Pennsylvania.  
13 The publicly available record thus far consists of the  
14 initial and amended filings made by the Applicant, the  
15 public comments and supplemental documents. Public  
16 portions of the Form A Filing, the amendments thereto  
17 and related documents have been and remain available  
18 on the Department's website.

19           The public files are also available for  
20 review and copying at the Department's offices in  
21 Harrisburg. The government rate for copying is 25  
22 cents per standard page and \$2 for a legal-sized page.  
23 We request that the copying and shipping charges be  
24 pre-paid. In addition, there is an index of all the  
25 documents posted on the website. Copies of the public

1 file index are also available for inspection at the  
2 registration table.

3           The subject of the hearing today is the  
4 proposed transit --- proposed transaction described in  
5 the Form A Filing before the Department. The purpose  
6 of today's hearing is not to reach a final decision on  
7 the Form A Filing. Instead, the purpose of the  
8 hearing is to receive comments from interested persons  
9 to aid the Department in making a decision as to  
10 whether it will be approved --- it will approve the  
11 transaction.

12           The Insurance Department will make a  
13 decision based upon the standards set forth in the  
14 statute known as the Insurance Holding Companies Act.  
15 The Act requires the Department to look at a number of  
16 factors, including the impact of the transaction on  
17 the insurance marketplace, whether the transaction  
18 would be hazardous to the insurance buying public and  
19 whether the plans proposed of the acquiring party are  
20 fair, reasonable, confer benefit on policyholders and  
21 are in the public interest. Another factor the  
22 Department will look at is the competency, integrity  
23 and experience of the acquiring party.

24           The entire record of the filing,  
25 including the transcript of the hearing, and any

1 materials submitted in connection with or following  
2 the hearing will be reviewed by the Department.  
3 Before any final conclusions are reached, the  
4 Department will closely consider any comments about  
5 the filing presented here today. Once again, no final  
6 decision will be rendered at the conclusion of today's  
7 hearing.

8                   This is a public informational hearing.  
9 All interested persons are invited to provide their  
10 comments or raise questions for the parties' and the  
11 Department's consideration about the Form A Filing.  
12 Comments and the information gathered here today will  
13 be considered, along with other material the  
14 Department has received, as it continues its review  
15 and analysis of the filing.

16                   To facilitate the review, this hearing  
17 is being recorded by a court reporter. The Department  
18 will review the transcript of today's hearing as part  
19 of its examination of the filing. A copy of the  
20 transcript will be available on our website.

21                   Please note that because of the nature  
22 of today's proceeding, Cross Examination or  
23 interrogation of speakers will not be permitted.  
24 Commenters are asked to direct their questions to the  
25 Department. The Department will take those questions

1 into account. The Department may have questions for  
2 the Applicant and may pose commenters' questions to  
3 the Applicant as well.

4 The Applicant is asked to respond to  
5 these questions to the best of their ability, but may  
6 supplement or provide its answers in writing. Indeed,  
7 the Applicant is not required to respond to those  
8 questions today. Following today's hearing, the  
9 Department will require written responses to all  
10 questions raised during the hearing, irrespective of  
11 whether they're raised by the commentators or by the  
12 Department. And we'll make those responses available  
13 on our website.

14 We will begin this morning with the  
15 presentation by the seller and the Applicant. These  
16 presentations may include presentations by  
17 multi-individuals. Next, the Department's expert will  
18 make a presentation. Then the public comment portion  
19 of the hearing will begin. During this segment of the  
20 hearing, any member of the public may make a  
21 presentation. The Department would welcome any  
22 commentator to also submit a written copy of their  
23 presentation and any other written materials or  
24 comments that it wishes the Department to consider.  
25 Anyone wishing to speak should sign up at the

1 registration desk, if you have not already.

2           When speaking, please indicate if you're  
3 speaking on your own behalf. If you're speaking in a  
4 representative capacity, please identify your role and  
5 the relationship to the represented organization.  
6 Your remarks should be specific and related to the  
7 Form A Filing that is before the Department. As noted  
8 earlier, any public commenter may pose questions for  
9 the Applicant, but such questions should be given to  
10 the Department in writing. Additionally, the  
11 Department may have questions for the commentators'  
12 during the commentators' presentations.

13           At the conclusion of the public comment  
14 portion of the hearing, we'll take a short break, then  
15 the Department will ask the Applicant questions. All  
16 responses will be sworn. At the end of the question  
17 and answer portion of the hearing, if time permits,  
18 the members of the general public may present brief  
19 additional comments. Then the Applicant will have the  
20 opportunity to present a brief closing statement.

21           So with that, we will begin the hearing  
22 today with the seller's presentation. And again, as  
23 you --- please introduce yourselves for the record and  
24 your position and organization as you do so.

25                           ATTORNEY PHILLIPS:

1                   Thank you. Good morning. I'm Maureen  
2 Phillips, General Counsel and Senior Vice President of  
3 OneBeacon Insurance Group. I've been involved in and  
4 overseeing the legal and regulatory work on  
5 OneBeacon's side of the transaction. We would like to  
6 thank Deputy Commissioner Johnson and other members of  
7 the Pennsylvania Insurance Department for scheduling  
8 this hearing, for the substantial efforts the  
9 Department has made in its consideration of the  
10 proposed transaction, and between what --- the  
11 proposed transaction between OneBeacon Insurance Group  
12 and Trebuchet U.S. Holdings, the transaction that  
13 brings all of us here today.

14                   Trebuchet is a subsidiary of Armor Group  
15 Holdings Limited. And for the sake of convenience  
16 today, we will refer to that entity as Armor  
17 throughout the rest of this presentation. In terms of  
18 the purpose of the presentation, we understand that  
19 this public hearing is designed to provide an  
20 opportunity for interested persons and policyholders  
21 to present their comments about the transaction in a  
22 public forum.

23                   The Department has received and reviewed  
24 a very substantial amount of information relating to  
25 the proposed transaction. And our speakers today do

1 not intend to repeat or summarize all of that  
2 information that is already in the public record.  
3 Various public comments have also been submitted to  
4 the Department, and those comments, as well as our  
5 written responses, are also in the record.

6           In addition to my remarks today, you  
7 will hear from our Chief Financial Officer, Paul  
8 McDonough. Paul's presentation will be followed by  
9 two speakers from Towers Watson, independent actuaries  
10 who have reviewed the strength of the proposed closing  
11 balance sheets and tested those balance sheets in a  
12 rigorous stochastic modeling analysis. Mr. Brad  
13 Huntington, CEO of Armor, will then address Armor's  
14 purchase and its extensive and successful experience  
15 in managing runoff insurance operations and  
16 portfolios. Our remarks today will focus on the  
17 background of this transaction and how the transaction  
18 meets the statutory standards under Pennsylvania law,  
19 including the benefits of the transaction to the  
20 public and to the policyholders.

21           Seven factors are primarily the outline  
22 for --- under Pennsylvania's Insurance Holding Company  
23 Act that guides this transaction and the Insurance  
24 Department's consideration. The Insurance Holding  
25 Companies Act provides that the Department shall

1 approve this transaction unless one or more of the  
2 seven factors set forth in the Act, Section 1402,  
3 actually requires disapproval. The record here  
4 demonstrates that those factors do not apply and that  
5 this transaction should be approved.

6           The first, second and seventh factors  
7 listed in Section 1402 involve situations that are  
8 simply not implicated here, such as the creation of a  
9 monopoly or the conversion of a mutual insurance  
10 company to a stock company. Factors three through six  
11 of the Act relate to the public interest issues, and  
12 in analyzing those factors, it's clear that the Act  
13 supports approval of this transaction. The third and  
14 fifth factors under the Act, for example, allow the  
15 Department to review the financial condition,  
16 competence and experience of Armor.

17           Under the fourth factor, the Department  
18 reviews the transaction to determine whether Armor  
19 intends to make any material changes to the management  
20 of the business that are, quote, unfair and  
21 unreasonable and fail to confer benefit on the  
22 policyholders of the insurer and are not in the public  
23 interest, unquote. There is no financial instability,  
24 potential harm or absence of managerial experience at  
25 issue here today. In fact, as Mr. McDonough will

1 explain, there are clear benefits to policyholders.  
2 Armor is an experienced runoff manager and the record  
3 demonstrates that Armor will have the right amount of  
4 dedicated assets available to manage the business as  
5 it continues to runoff.

6           The proposed closing balance sheets are  
7 consistent with the needs of the business. These are  
8 all benefits of efficiency and focus for the  
9 policyholders of the insurance companies involved in  
10 this transaction, including both the policyholders of  
11 OBIC and the policyholders of ASIC.

12           Finally, the sixth factor provides that  
13 the Department should consider whether the acquisition  
14 of control is likely to be hazardous or prejudicial to  
15 the insurance-buying public, generally. There is  
16 nothing prejudicial or hazardous about this  
17 transaction. Armor is an experienced and  
18 well-qualified runoff manager with the deep expertise  
19 and focus needed to effectively manage the runoff  
20 companies. The liabilities of the runoff companies  
21 will be managed with sufficient assets specifically  
22 designed for that very purpose.

23           The Department has gone to tremendous  
24 lengths, working with the parties to this transaction,  
25 working with its own in-house experts and outside

1 Counsel, and with two sets of independent experts in  
2 its analysis, in order to ensure that the assets of  
3 the runoff companies post sale, which include both  
4 reserves and surplus, will be adequate to satisfy the  
5 liabilities of the runoff companies into the future.  
6 In fact, those runoff policyholders --- in fact, those  
7 policyholders of the runoff companies who have filed  
8 written comments and who are appearing today have  
9 framed the issue in the very same manner in which it  
10 has been analyzed by the Department.

11           For example, in its public comment filed  
12 with the Department, the Pennsylvania Manufacturers'  
13 Association framed this issue as a, quote, interest in  
14 assuring that the acquired companies are adequately  
15 capitalized, properly reserved and capable of  
16 providing timely and professional claims management  
17 services for the foreseeable future, end quote. In  
18 its public comments, Colgate likewise has identified  
19 the exact same issues. The relevant information about  
20 the capitalization of the runoff companies is in the  
21 record, and that information, which will be summarized  
22 by various speakers today, demonstrates that this  
23 transaction meets the statutory standards.

24           In just a few moments, Paul McDonough  
25 will present the background that explains how we

1 arrived here today, and he will review some of the  
2 relevant details, including benefits for policyholders  
3 of the runoff companies. Paul will also review the  
4 closing balance sheets which reflect the very  
5 significant assets that will be exclusively dedicated  
6 to satisfying the runoff companies' liabilities.  
7 Following Mr. McDonough, you will hear from Mr.  
8 Christopher Bozeman and Ms. Sandra Santomeno of Towers  
9 Watson, one of the leading global actuarial consulting  
10 firms, who will present their findings with respect to  
11 the proposed transaction.

12                   At the Department's suggestion that  
13 OneBeacon hire experts to prepare two independent  
14 studies relating to the transaction, we retained  
15 Towers Watson. They prepared a ground-up study of the  
16 liabilities of the runoff companies, and then prepared  
17 a stochastic study of the assets and liabilities on  
18 the proposed balance sheets of the runoff companies at  
19 closing.

20                   Finally, you will hear from  
21 representatives of Armor, Steve Davis and Brad  
22 Huntington, regarding Armor's substantial  
23 qualifications and experience in managing runoff  
24 portfolios. Mr. McDonough will be available after the  
25 conclusion of the formal presentation and following

1 public comments to answer any of the Department's  
2 questions.

3                   One final comment. We received a letter  
4 from Counsel for Colgate Palmolive last Friday evening  
5 containing comments on the transaction, and an exhibit  
6 with additional comments from someone retained by  
7 Counsel for Colgate to review the Tower Watson  
8 reports. We also received a letter yesterday, a  
9 letter from Counsel for the PMA with a report from Mr.  
10 Jonathan Terrell. Lastly, three other comment letters  
11 were also received very late in the day yesterday.

12                   As we informed the Department by letter  
13 on Monday, it's our full intention to formally address  
14 the matters raised in those new submissions --- it's  
15 not our intention to address those issues raised in  
16 those submissions yesterday, but rather, given the  
17 lateness of their delivery and the recognition of this  
18 proceeding, that it is time primarily intended to  
19 address the public --- to allow the public to address  
20 their comments. We will respond in full in writing  
21 following the hearing.

22                   Of course, following --- depending upon  
23 the content of the public comments by the participants  
24 herein today, we may conclude that it would be  
25 appropriate and helpful to provide a few additional

1 comments later in the proceeding for purposes of  
2 clarification or correction of the record. We trust  
3 the Department will indulge us in that event. I will  
4 now turn this over to Paul.

5 MR. MCDONOUGH:

6 Thank you, Maureen. I echo my  
7 colleague's thanks to the Department for the work  
8 around the transaction and for the opportunity to  
9 speak here today. I will focus my comments primarily  
10 on, number one, our motivation in selling our runoff  
11 business, and number two, the benefits of the proposed  
12 transaction to the policyholders of the transferring  
13 companies. In the process, I'll also provide some  
14 perspective on the financial terms of the transaction,  
15 including the proposed closing balance sheets pro  
16 forms as of June 30, 2014.

17 OneBeacon began a restructuring process  
18 in 2009, which we believed would be in the best  
19 interest of all of our policyholders and also the  
20 future of the company. The transaction that is the  
21 subject of this hearing is one step in that process.  
22 Our primary motivation in selling our runoff business  
23 has been to allow the OneBeacon management team to  
24 focus exclusively on managing our ongoing specialty  
25 operation and to transfer the management of the runoff

1 operations to runoff specialists who focus exclusively  
2 on managing runoff business.

3           After reviewing a number of options, we  
4 determined that a transaction with Armor was the best  
5 alternative because, number one, it is economically  
6 neutral to OneBeacon. That is, the cost of the sale  
7 is comparable to the cost of continuing to administer  
8 the runoff business internally. And secondly, it  
9 meets OneBeacon's goal of freeing up the OneBeacon  
10 management team to focus exclusively on the ongoing  
11 business while transferring the runoff business to a  
12 runoff specialist focused exclusively on managing  
13 runoff business, which again was our primary  
14 motivation and objective in exploring the sale. An  
15 additional and important benefit to the transaction is  
16 that the sale to Armor would put the ongoing and  
17 runoff liabilities under separate ownership with  
18 separate assets designated to support each separate  
19 set of liabilities.

20           Our runoff business consists of legacy  
21 liabilities predating the White Mountain's acquisition  
22 of CGU back in 2001 and more recent liabilities  
23 relating to our standard commercial operation that was  
24 sold on a renewal rights basis in 2009. In the wake  
25 of the 2009 sale, we began to organize our claims

1 operation into two separate groups, one that manages  
2 our ongoing claims and one that manages our runoff  
3 claims. In addition, and after a series of  
4 discussions with the Department, we began the process  
5 of rationalizing our legal entity structure.

6           During that process, we began to think  
7 about the benefits of creating two separate groups of  
8 legal entities, one to support our ongoing business  
9 and one to support our runoff business. This led to  
10 the restructuring that we initiated in the fourth  
11 quarter of 2012. The main elements of the  
12 restructuring include, first, terminating the former  
13 OneBeacon pooling arrangement wherein the ongoing and  
14 runoff liabilities surplus and assets were comingled  
15 in a single group of companies; second, establishing a  
16 new set of intra-company reinsurance arrangements that  
17 cede all of the ongoing specialty business to Atlantic  
18 Specialty Insurance Company as the lead company in  
19 support of the ongoing business, and cede all of the  
20 runoff business to OneBeacon Insurance Company as the  
21 lead company in support of the runoff business.

22           Third, moving capital between and among  
23 the companies through a series of capital  
24 contributions and dividends in a way that is  
25 consistent with the runoff and specialty liabilities

1 being ceded via the new intra-company reinsurance  
2 agreements. Fourth, merging certain companies into  
3 other companies to simplify the number of legal  
4 entities and states of domicile. And lastly, creating  
5 new companies where necessary to support the ongoing  
6 specialty operations, all of which, of course, was  
7 subject to and received regulatory approval.

8           The first page of the handouts that you  
9 have, the packet that you have, under the tab labeled  
10 Paul McDonough, summarizes the legal entity  
11 organization structure as of June 30, 2014, after much  
12 of the restructuring had already been completed. Note  
13 that although we have ceded all of the ongoing  
14 business to Atlantic Specialty Insurance Company and  
15 all of the runoff business to OneBeacon Insurance  
16 Company, and as I just mentioned, have adjusted  
17 capital accordingly, since the two companies are under  
18 common ownership and Atlantic Specialty Insurance  
19 Company is a subsidiary of OneBeacon Insurance  
20 Company, they still operate effectively as a single  
21 group.

22           The second page in this section of the  
23 handout represents the effect of the final step of the  
24 restructuring, which is to dividend Atlantic Specialty  
25 Insurance Company from OneBeacon Insurance Company to

1 its parent, OneBeacon, LLC, which would complete the  
2 separation of the ongoing and runoff groups of  
3 companies and would position the runoff companies to  
4 be transferred to Armor in the proposed sale. The  
5 next page in the handout, the final page in my  
6 section, summarizes the balance sheet of OneBeacon  
7 Insurance Company on a consolidated basis, including  
8 its subsidiary, Atlantic Specialty Insurance Company,  
9 and combined with Potomac Insurance Company as of June  
10 30, 2014, in the left-hand column, and pro forma for  
11 the final step of the restructuring and the proposed  
12 sale in the right-hand column.

13                   Note that before the final step of the  
14 restructuring and the proposed sale, OneBeacon  
15 Insurance Company on a consolidated basis and combined  
16 with Potomac has more assets and more surplus than  
17 post sale. But before the final step of the  
18 restructuring and the proposed sale, it also has more  
19 liabilities, not just the runoff liabilities, but also  
20 liabilities of the ongoing specialty business,  
21 including the lost reserves and under premium reserves  
22 of the specialty business, with exposure to natural  
23 catastrophe and terrorism related losses. Pre-final  
24 restructuring step and proposed sale, the consolidated  
25 OneBeacon Insurance Company also remains exposed to

1 certain emerging risks that may relate to our ongoing  
2 book of business, but would likely not relate to our  
3 runoff book of business. For example, risks relating  
4 to new theories of cyber liability or nano technology  
5 or climate change or hydrofracking, et cetera.

6           The primary question post sale is with  
7 the runoff liabilities now separate and distinct, and  
8 importantly, under separate ownership from the  
9 liabilities of OneBeacon's ongoing specialty business,  
10 are the assets in OneBeacon Insurance Company at the  
11 closing of the sale sufficient to fund the projected  
12 claim payments of OneBeacon Insurance Company on a  
13 consolidate basis to the ultimate resolution of those  
14 claims. This is the central question posed to us by  
15 the Pennsylvania Insurance Department in the context  
16 of their review of the proposed transaction.

17           To answer this question, we engaged  
18 Towers Watson to perform a stochastic analysis of how  
19 the business can be expected to perform with our  
20 proposed closing balance sheet as the starting point.  
21 You'll hear from Towers Watson directly later in this  
22 hearing, but the conclusion of the stochastic modeling  
23 is that the proposed closing balance sheet has a very  
24 high probability of funding all of the potential  
25 future claims across a wide distribution of potential

1 outcomes, including extreme scenarios in the tail of  
2 the distribution of potential outcomes. It's worth  
3 noting that no insurance company, whether ongoing or  
4 runoff, no matter how well capitalized, has a 100  
5 percent probability of funding all of its potential  
6 future claims. The tail risk associated with lost  
7 reserves and other enterprise risks is simply too  
8 great. The competence level for the runoff companies  
9 in this proposed transaction we believe is more than  
10 sufficient to meet the appropriate applicable  
11 regulatory standards.

12                   In the context of the results of the  
13 Towers Watson stochastic modeling of the proposed  
14 closing balance sheet, we believe it is reasonable to  
15 conclude that policyholders of OneBeacon Insurance  
16 Company are better off after the proposed sale than  
17 before it, due to the following primary benefits of  
18 the transaction: first, the management of OneBeacon  
19 Insurance Company post close would be focused  
20 exclusively on managing the runoff operation, which we  
21 believe will result in better outcomes on average for  
22 all policyholders. And second, the runoff liabilities  
23 post close of the sale would be under separate  
24 ownership from the ongoing liabilities with assets  
25 designated exclusively for the satisfaction of the

1 runoff liabilities with no exposure to the ongoing  
2 liabilities and risks of the ongoing company.

3                   That concludes my prepared remarks.  
4 Thank you again for the opportunity to speak. I  
5 believe Mr. Bozeman and Ms. Santomeno from Towers  
6 Watson will now review with you the process and  
7 conclusions of their loss and loss adjustment  
8 calculations, as well as the results of their  
9 stochastic modeling in relation to the proposed  
10 closing balance sheet.

11                   MR. BOZEMAN:

12                   Thank you. Good morning. I am Chris  
13 Bozeman and I am a Director of Consulting Services for  
14 the risk consulting and software business of Towers  
15 Watson. I am a fellow of the Casualty Actuarial  
16 Society and a member of the American Academy of  
17 Actuaries, and I meet the Academy's qualification  
18 standards to perform the services pertinent to this  
19 testimony.

20                   I have been working in the actuarial  
21 field for nearly 25 years. I am joined today by my  
22 colleague, Sandy Santomeno. Sandy is a Senior  
23 Consultant at Towers Watson. I am currently the head  
24 of the Property and Casualty Consulting Practice for  
25 the Philadelphia office of Towers Watson, and I serve

1 as co-leader for our Loss Reserving Product Group for  
2 the Americas. My main practice areas are loss  
3 reserving, economic capital modeling and mergers and  
4 acquisitions works as part of the risk consulting and  
5 software, or RCS business, of Towers Watson. Sandy  
6 and I oversaw the work on the engagements that we will  
7 discuss this morning.

8                   Now, I would like to give you some more  
9 background on Towers Watson. Towers Watson is a  
10 leading global professional services company with more  
11 than 14,000 associates around the world. The RCS  
12 business, in addition to its consulting role, brings  
13 leading software products to the market, including the  
14 Igloo financial modeling software and Rescue reserving  
15 software, both of which were used for this assignment.

16                   The RCS business is part of the risk and  
17 financial services line of business, which also  
18 includes our investment consulting business. In  
19 addition, Towers Watson maintains a robust  
20 professional excellence policy. Before undertaking  
21 any work, we must be confident that we have the  
22 necessary qualifications and resources to do the work  
23 and that there are no real or perceived conflicts of  
24 interest.

25                   Relevant to these assignments, we have

1 industry leading expertise in asbestos and  
2 environmental reserving. In fact, Towers Watson  
3 Consultants first developed ground-up exposure-based  
4 methodologies in the 1990s. We have significant  
5 expertise in Workers' Compensation reserving. Since  
6 2012, our firm has reviewed over \$50 billion in  
7 industry Workers' Compensation reserves. Our Igloo  
8 financial modeling software is perfectly suited for  
9 stochastic financial modeling. And on the consulting  
10 side, we advise a large number of companies on  
11 economic capital modeling, and in particular, reserve  
12 variability.

13 All the work on these projects was  
14 subject to independent peer review by qualified  
15 colleagues not otherwise involved in the work, and our  
16 project team had access to all the firm's intellectual  
17 capital and expertise on a global basis. Towers  
18 Watson's fees for this project were based on hourly  
19 time charges and were in no way contingent upon the  
20 results of the work.

21 Now, I will provide some background on  
22 Towers Watson's role in this process. We were  
23 originally engaged by OneBeacon at the end of 2012 to  
24 perform an independent review and report on  
25 OneBeacon's loss and loss adjustment expense reserves

1 for the business subject to the proposed sale to  
2 Armor. We understood that at that time that our work  
3 would be reviewed by the Pennsylvania Insurance  
4 Department as part of the Form A process. We  
5 completed our report in September of 2013 and a  
6 summary report has been made public in the Form A  
7 materials.

8                   Then in December of 2013, OneBeacon  
9 engaged Towers Watson to perform stochastic modeling  
10 of the runoff companies for the purpose of providing  
11 estimates of the probability that the assets on the  
12 proposed balance sheet as of June 30th, 2014, would be  
13 sufficient to fund all of the obligations of the  
14 runoff companies. In response --- and this was done  
15 in response to a request from the Pennsylvania  
16 Insurance Department. This report was completed in  
17 June of 2014 and a summary report is also available in  
18 the Form A materials.

19                   To provide you with an overview of what  
20 we will review today, I will first provide some  
21 discussion on the high level approach and conclusions  
22 from both our reserve analysis and our stochastic  
23 modeling, then move on to a more detailed discussion  
24 of the approach and methodologies we used for lines  
25 other than asbestos, pollution and other mass torts,

1 the non-NICO lines. My colleague, Sandy Santomeno,  
2 will follow and provide a similar discussion for the  
3 NICO lines, which are the asbestos, pollution and  
4 other mass torts. After Ms. Santomeno's remarks, I  
5 will review the general approach we used for the  
6 stochastic modeling and conclude our presentation.

7           In the reserve report, Towers Watson  
8 derived independent estimates of actuarial central  
9 estimates and a range of reasonable estimates of  
10 reserves on a net of reinsurance basis. We analyzed  
11 the NICO and the non-NICO lines separately. The  
12 actuarial central estimate is intended to represent  
13 the expected loss and loss adjustment expense values  
14 over a range of reasonably foreseeable outcomes. The  
15 ranges in our reserve report were intended to  
16 represent ranges of reasonable estimates of the  
17 actuarial central estimate and were not intended to  
18 encompass all possible outcomes.

19           Our review encompassed all loss and loss  
20 adjustment expense reserves, including unallocated  
21 loss adjustment expenses and a separate provision for  
22 uncollectable reinsurance. Our analysis was performed  
23 both gross and net of two large reinsurance streams,  
24 the general reinsurance adverse development cover,  
25 applying to the runoff of accident year 2000 and prior

1 claims for the non-NICO lines, and the NICO cover,  
2 applying to future asbestos, pollution and other mass  
3 tort losses subject to an aggregate limit.

4           The focus of our review was to provide  
5 an independent estimate of the unpaid loss and loss  
6 adjustment expenses, not to provide commentary on  
7 OneBeacon's held reserves. So we did not directly  
8 compare our conclusions with the corresponding amounts  
9 held by OneBeacon in select reserves. In the reserve  
10 report, we discounted reserves based on the payout  
11 patterns derived in our reserve analysis and expected  
12 investment returns on the asset portfolio. We do not  
13 believe the discounted figures shown in our reserve  
14 summary report are important now, however, in  
15 understanding the economics of the runoff business, as  
16 the analysis in the stochastic report is more detailed  
17 and comprehensive.

18           In our reserve report, we updated our  
19 NICO and non-NICO projections using data through March  
20 31st, 2013. In conducting this role forward, we  
21 reviewed actual versus expected paid and reported loss  
22 and LAE activity for the period between the evaluation  
23 date of the review and March 31st, 2013.

24           I am now going to discuss our key  
25 conclusions from the reserve report, which are

1 summarized on the slides on the handout with the title  
2 Christopher Bozeman. So if you go to slide one after  
3 the title page, this shows our actuarial central  
4 estimate and range of reasonable estimates on an  
5 undiscounted basis for the non-NICO lines, net of all  
6 reinsurance except for the general reinsurance adverse  
7 development cover at various evaluation dates.

8           First, we show our estimates as of  
9 September 30th of 2012, which was the evaluation date  
10 of the data that we used for our full independent  
11 study of the non-NICO lines. As shown on the slide,  
12 our actuarial central estimate of unpaid loss in LAE  
13 --- or ALAE as of September 2012 for the non-NICO  
14 lines was \$861 million gross of the general  
15 reinsurance adverse development cover on an  
16 undiscounted basis for the projected range of  
17 reasonable estimates of \$786 million to \$996 million.  
18 In our reserve report, we then conducted a roll  
19 forward of the results to March 31st, 2013. The  
20 resulting range of estimates is also shown on the  
21 slide.

22           In our stochastic report, we then  
23 reviewed the data as of September 30th, 2013 and  
24 conducted a similar roll forward from March 31st, 2013  
25 to September 30th, 2013. And the results are shown on

1 the slide as well. Finally, we derived an estimate of  
2 the unpaid amounts as of June 30th, 2014 by  
3 subtracting the estimates paid from September 2013 to  
4 June 30th, 2014. These resulting estimates at June  
5 2014, which are shown here, are then directly used in  
6 our stochastic model.

7 Now I will turn to the NICO lines, if we  
8 refer to the next slide. This slide shows our  
9 actuarial central estimate and range of reasonable  
10 estimate on an undiscounted basis for the NICO lines,  
11 net of all reinsurance except for the NICO treaty and  
12 at various evaluation dates. On NICO lines we  
13 reviewed all the reserves independently using data as  
14 of December 31st, 2012. For asbestos and pollution,  
15 we used Towers Watson's proprietary ground-up exposure  
16 based models, which Sandy will describe in more detail  
17 shortly.

18 As shown on the slide, our actuarial  
19 central estimate of net unpaid loss and LAE for the  
20 NICO lines on an undiscounted basis and before the  
21 application of the NICO treaty was \$1 billion and \$5  
22 million, with a range of reasonable estimates from  
23 \$885 million to \$1,214,000,000. For reference, the  
24 remaining NICO treaty limit applicable loss and LAE  
25 payments after December 31st, 2012 was \$984 million.

1 Similar to the non-NICO lines, we then conducted the  
2 roll forward of the estimates for the NICO lines. The  
3 estimated unpaid as of June 2014 shown on this slide  
4 was then also used in the stochastic modeling.

5           Now, let's move on to the stochastic  
6 report. As just described, the roll forward of the  
7 estimates from the reserve report warrants a basis for  
8 the parameterization performed in the stochastic  
9 modeling. The focus of the stochastic analysis was  
10 the construction of a probabilistic distribution of  
11 potential future outcomes for the runoff business  
12 subject to this transaction through the use of a  
13 stochastic modeling. This distribution was then used  
14 to estimate the percentage of future scenarios in  
15 which the assets on the open balance sheet would be  
16 sufficient to fund the obligations in the runoff  
17 companies in the future, including claim payments and  
18 all associated expenses.

19           Please turn to the third slide, which  
20 reflects the results from running 10,000 simulations  
21 from our stochastic model. As you can see from the  
22 slide, the company is projected to meet all of its  
23 obligations through the first 30 years and about 90  
24 percent of the time. Through 70 years, when we expect  
25 all claims to have been paid, the company is projected

1 to meet all of its obligations in over 88 percent of  
2 the cases.

3           As I mentioned, I will now provide a  
4 more detailed discussion of our approach and  
5 methodologies for both the reserve report and the  
6 stochastic modeling of the non-NICO lines. We used  
7 several actuarial sound approaches in preparing the  
8 two reports. In our reserve report, Towers Watson  
9 developed estimates of the non-NICO lines based  
10 primarily on traditional generally accepted actuarial  
11 methods, most notably the incurred loss development  
12 method and the paid loss development method. For  
13 personal injury protection, or PIP, individual  
14 modeling was performed at the claim level,  
15 incorporating estimates of medical inflation and  
16 mortality.

17           For Workers' Compensation, which was the  
18 largest and longest tail line in the non-NICO segment,  
19 a great deal of effort went into projecting tail  
20 development factors. And much of the uncertainty in  
21 the range of estimates was due to the uncertainty in  
22 the tail factors. Our final ranges in the reserve  
23 report reflect diversification between the lines based  
24 on expected correlations between the lines of  
25 business.

1                   Now I would like to turn this over to my  
2 colleague, Sandy Santomeno. Sandy will provide  
3 further detail with respect to our reports as they  
4 relate to the NICO lines.

5                   MS. SANTOMENO:

6                   Good morning. I just want to provide a  
7 little background on myself. I'm the Senior  
8 Consultant at Towers Watson. I'm part of the Towers  
9 Watson asbestos and environmental, or A&E, Team and I  
10 provide A&E expertise to manufacturers or  
11 policyholders, insurance and reinsurance companies. I  
12 have more than 34 years working in an actuarial  
13 capacity. I'm associate of the Casualty Actuarial  
14 Society and a member of the American Academy of  
15 Actuaries, and I meet the Academy's qualification  
16 standards to perform the services pertinent to this  
17 testimony.

18                   I have spent the past 26 years providing  
19 actuarial and risk evaluation services on discontinued  
20 businesses and A&E exposures. My role in this  
21 assignment was project manager for both the reserving  
22 and stochastic modeling projects. I was also the A&E  
23 project lead.

24                   As Chris mentioned, I will discuss our  
25 modeling approaches, specifically with respect to the

1 NICO lines. We relied upon two basic approaches to  
2 evaluating asbestos conclusion liabilities, a  
3 ground-up exposure analysis and aggregate methods. A  
4 ground-up exposure analysis is based on an insurer's  
5 own evaluation of policyholder costs based on policies  
6 written for defendants. The ground-up analysis is the  
7 approach preferred by the actuarial profession and  
8 most rating agencies. As more commonly used,  
9 actuarial methods do not work well when evaluating A&E  
10 liabilities.

11           For example, A Invest, a leading rating  
12 agency, has stated that it will give significantly  
13 greater weight to a company's ground-up study results  
14 than it does to the results of the agency's own study,  
15 which typically employs aggregate methods. Aggregate  
16 methods rely upon aggregate benchmarks determined by  
17 the industry data and experience, and should be used  
18 with caution since it is possible that an individual's  
19 --- individual company's own claim experience may  
20 deviate perhaps significantly from that of the  
21 industry.

22           Within the context of this analysis, we  
23 did not use the aggregate approach for asbestos  
24 because the exposure-based method is clearly superior  
25 to the aggregate approach. For pollution --- for the

1 pollution analysis, we placed most of our reliance on  
2 the ground-up model and only minimal reliance on the  
3 results of the aggregate methods.

4           Now moving into the asbestos analysis.  
5 For our asbestos exposure analysis, Towers Watson has  
6 used the ground-up method for nearly two decades with  
7 updates and improvements as litigation and legislation  
8 of environments have changed. The ground-up exposure  
9 analysis was pioneered by TW and involves identifying  
10 and studying a large proportion of individual  
11 policyholder open accounts and determining each  
12 account's ground-up asbestos liabilities using a  
13 frequency and severity approach.

14           Claim frequency is the number of claims  
15 alleging asbestos exposure expected to be filed  
16 against the policyholder. We forecast claim frequency  
17 using Towers Watson's industry benchmark claim filing  
18 patterns. Towers Watson's --- their filing pattern  
19 --- benchmark filing patterns are based on  
20 epidemiological assumptions and observed industry  
21 claim data and are regularly calibrated for the  
22 following emerging issues, such as increased mortality  
23 assumptions as people are living longer,  
24 non-occupation or take-home exposure claims, increased  
25 filings due to the role of social media and

1 recruitment and better diagnosis of asbestos-related  
2 disease. Once we determine the future number of  
3 claims expected to be filed against the policyholder,  
4 we determine how many of these claims will be paid and  
5 how many will be dismissed without payment, which is  
6 called the payment rate.

7           Next we move on to severity. Claim  
8 severity or the average claim costs are then  
9 determined by looking at the policyholder's historical  
10 indemnity losses divided by the number of claims they  
11 have closed with payment. The average claim cost is  
12 then trended for future inflation using the following  
13 inflation assumptions: we use a long-term medical  
14 claims inflation rate of three percent. We reduce  
15 this by one percent to reflect the aging of claimants  
16 over time. We note that the actual claim severities  
17 over the past eight years have exhibited flat to  
18 negative severity trends by disease.

19           Once we forecast the number of future  
20 claims, the frequency and their future trended average  
21 cost, severity, the product of the two is the forecast  
22 of future indemnity losses for each policyholder from  
23 the ground up. The next step is to determine  
24 OneBeacon's share of the future loss estimate. We  
25 worked with OneBeacon and NICO claims to determine

1 OneBeacon's gross losses by applying the terms and  
2 conditions of OneBeacon's policies to estimate  
3 OneBeacon's gross share of the policyholder ground-up  
4 loss. And we also incorporate the impact of special  
5 claims settlements or coverage issues that may be ---  
6 may be in effect. Next we apply OneBeacon's own  
7 reinsurance protections, facultative and treaty  
8 reinsurance, by account to estimate OneBeacon's net  
9 losses.

10                   Now so far I've talked about estimated  
11 losses on known policyholder accounts. Next we  
12 estimate incurred but not reported, or IBNR, losses,  
13 which fall into two categories. The first category is  
14 an IBNR provision for claim development on known  
15 policyholder accounts, which contemplates potential  
16 upwards development of count estimates based on the  
17 emergence of additional information. We observe these  
18 trends historically. The second category of IBNR is a  
19 pure IBNR provision which contemplates the development  
20 of newly emerging or previously unknown policyholder  
21 accounts with asbestos exposures.

22                   Up until now we've described the process  
23 of forecasting indemnity by account. Next we  
24 determined what the defense cost estimates will be.  
25 For defense costs, we estimate a provision for future

1 costs by using a ratio of defense costs to indemnity  
2 costs. And secondly, we also estimate a provision for  
3 future coverage disputes --- the cost of future  
4 coverage disputes, generally by using the ratio of  
5 costs to indemnity costs.

6           For our reserve report, to determine a  
7 range around our central estimate, we vary most of the  
8 parameter selections I've just discussed. However, we  
9 do not vary assumptions associated with the asbestos  
10 litigation environment, for better or worse, since  
11 this would be highly speculative. We note that the  
12 asbestos litigation environment has been improving for  
13 the past eight to nine years. However, for our  
14 stochastic model, modeling the extreme low and high  
15 estimates, those below the low estimates of our  
16 reserve report and those above the high estimates of  
17 the reserve report, there is implicit provision for  
18 unforeseen events such as changes to the litigation  
19 environment.

20           Moving on to our pollution analysis.  
21 Towers Watson uses proprietary ground-up pollution  
22 model based on studies pioneered by Towers Watson  
23 affiliates and detailed and actuarial research papers  
24 published in 1994, but also improved and updated as  
25 litigation and legislative environments have changed.

1 The steps taken are similar to the steps described in  
2 the asbestos analysis. For example, frequency,  
3 severity, IBNR and reinsurance with the following  
4 exceptions: there are additional steps taken to  
5 determine site remediation costs, the shares of  
6 individual policyholders and the method of allocation  
7 of losses to policy years. There is also a provision  
8 in the forecast for potential future natural resources  
9 damages.

10                   Secondly on pollution, we employed two  
11 aggregate development approaches, an aggregate loss  
12 development approach, which is based on payment and  
13 reporting patterns constructed by modeling the process  
14 of site discovery, litigation and remediation.  
15 Although there can be significant uncertainty with  
16 regard to remediation costs and the cost shares of  
17 individual insureds, we know that the Towers Watson  
18 pollution payment pattern simulations have produced  
19 consistent results for many years. Lastly, we  
20 employed a market share approach, which was used as a  
21 reasonableness check on the other methods, but we view  
22 this as the least reliable approach of the approaches  
23 used.

24                   For OneBeacon's other mass tort claims  
25 subject to the NICO treaty, we used a survival

1 approach. The survival approach measures how many  
2 years OneBeacon's reserves will last, assuming an  
3 average annual payment rate. We selected four, six  
4 and eight years for our low, central and high  
5 estimates of OneBeacon's mass tort --- other mass tort  
6 reserves. We selected OneBeacon's annual payment  
7 rate, using data for historical mass tort claim  
8 payments. That includes payments for mass torts that  
9 are not expected to continue or generate future  
10 losses, as well as mass torts that are. By doing  
11 this, we have implicitly reflected a provision for  
12 future claims arising for potentially new or  
13 unforeseen mass torts.

14                   With that, I will turn this back over to  
15 Chris for his final remarks about the stochastic study  
16 and conclusions.

17                   MR. BOZEMAN:

18                   Thank you, Sandy. I would like to  
19 supplement those comments with a brief summary of our  
20 general report to the stochastic modeling for both the  
21 NICO and the non-NICO lines. We used Towers Watson's  
22 Igloo software. We simulated 10,000 potential future  
23 outcomes over a 70-year period, at which time it is  
24 expected all claims will have been paid. The terms of  
25 the general reinsurance adverse development cover in

1 the NICO treaty, we're applied to each of the 10,000  
2 simulated scenarios explicitly.

3                   Volatility in asset returns was  
4 reflected as well as volatility in loss payments, both  
5 in the amounts of payments and the timing of payments.  
6 The modeling of the volatility and the loss payments  
7 reflects both parameter and process risks. Parameter  
8 risk refers to the risk that the selected parameters,  
9 such as the mean estimate of future payments, have  
10 been misestimated and therefore differ from their true  
11 but unknown values. Process risk reflects the risk  
12 that future outcomes deviate from the mean, even if  
13 the mean has been correctly identified.

14                   For each scenario, we used Towers  
15 Watson's economic scenario generator, which we call  
16 the ESG, which is used as basis to project a simulated  
17 timed series of interest rates, yield curves, credit  
18 spreads, equity returns and price and wage inflation.  
19 The volatility in the ESG output is calibrated based  
20 on the observed historical volatility for each  
21 variable.

22                   A significant part of the work done in  
23 this project involves quantifying the uncertainty in  
24 the amount and timing of future loss payments. As I  
25 discussed earlier, our roll forward estimates to June

1 30th, 2014 were used as the mean of the future loss  
2 and loss expense payments.

3           For the NICO lines, we put a statistical  
4 distribution to our low, central and high estimates.  
5 The distribution selected, the lognormal, is commonly  
6 used for modeling insurance loss distributions and has  
7 the property of being right-skewed, that is, the very  
8 high points on the distribution tend to be further  
9 from the mean than the very low points do. As a  
10 result, there are outcomes in the stochastic model  
11 that are considerably higher than our high reasonable  
12 estimates from the reserve report. While we do not  
13 individually describe the set of circumstances related  
14 to each simulation, one could think of the more  
15 extreme scenarios as being driven by changes in the  
16 future litigation environment or other unforeseen  
17 events not quantified in our reserve report.

18           For most non-NICO lines, we applied the  
19 following steps: we estimated future claims inflation  
20 for each line by estimating claims inflation as a  
21 function of future price and wage inflation as  
22 produced by the stream. We estimated the remaining  
23 uncertainty using a bootstrapping technique, which was  
24 applied to the historical data on a constant cost  
25 basis.

1                   The bootstrapping technique is a  
2 well-known and accepted technique commonly used by  
3 actuaries in the insurance industry to estimate and  
4 quantify uncertainty in reserve estimates, as well as  
5 the timing of future payouts. The inherent assumption  
6 in the bootstrapping technique as applied in this  
7 analysis is that the future volatility in the payments  
8 at the current cost levels will be similar to the  
9 historical observed volatility, once volatility due to  
10 inflation is removed. For the lines of business in  
11 which we applied this technique, we believe this to be  
12 a reasonable assumption.

13                   So turning back to the stochastic  
14 results on the third slide. Once we have derived the  
15 future uncertainty in the lost payment amounts and the  
16 uncertainty in the time at a constant cost level, we  
17 used the USG as a basis for stochastically projecting  
18 both future claims inflation and asset returns. We  
19 separately projected 10,000 simulations of 70 years of  
20 claim payments for the runoff business, and as I  
21 previously explained, the results of this modeling  
22 exercise demonstrate a high level of success  
23 throughout the universe of the 10,000 scenarios that  
24 we tested and a success rate of over 90 percent, as  
25 shown on the slide for the first 30 years.

1                   So to conclude, Towers Watson has  
2 provided OneBeacon and the Department with its full  
3 reserve analysis report and stochastic model forecast  
4 report, pursuant to which we employed the  
5 methodologies outlined here and reached the  
6 conclusions shown on these slides. Separate summaries  
7 of both reports were prepared and have been posted on  
8 the Department's website. We thank you for your time.  
9 And next up is Brad Huntington, the CEO of Armor.

10                   MR. JOHNSON:

11                   Okay, thank you. Armor want to come up?  
12 This is the actual Applicant. Good morning.

13                   MR. HUNTINGTON:

14                   Good morning. I am Brad Huntington, one  
15 of the two founders as well as the Chairman and CEO of  
16 the Armor Group. Firstly, I'd like to thank the  
17 Insurance Department for scheduling this hearing and  
18 for the significant amount of time and effort that has  
19 been put in to the application in connection with the  
20 proposed transaction.

21                   The purpose of my presentation today as  
22 set out on page two of the handout is to focus on the  
23 following items: firstly, who is Trebuchet U.S.  
24 Holdings, Inc. Secondly, what is Trebuchet's intent  
25 with respect to the OneBeacon runoff entities and

1 their liabilities? Thirdly, who is Armor Group?  
2 Fourthly, what is the expertise and experience of  
3 Armor and Trebuchet? And finally, why we believe the  
4 sale to Trebuchet should be approved.

5           Taking each of those in turn, the first  
6 item is who is Trebuchet U.S. Holdings? This is  
7 contained on page three of the handout. Trebuchet is  
8 a recently formed Delaware company, which was  
9 established to act as the purchaser in the proposed  
10 transaction. Its ultimate parent is Armor Group  
11 Holdings Limited, the holding company for what is  
12 known in the insurance industry as Armor Group.

13           Importantly and as already outlined in  
14 the detail provided by Mr. McDonough, at closing of  
15 the proposed transaction, Trebuchet will have the  
16 necessary amount of dedicated capital and assets  
17 available to acquire OneBeacon runoff entities and to  
18 begin the supervision of control over the entire  
19 runoff process. Further, as part of the approval  
20 process, considerable time and effort and attention  
21 has been addressed by all of the parties on the issue  
22 of capital adequacy and whether the proposed closing  
23 balance sheets are consistent with the proper  
24 management of the OneBeacon runoff entities as they  
25 continue runoff.

1                   Importantly, when considering the  
2 interest of the underlying policyholders is the fact  
3 that the transaction will not affect any of the  
4 third-party reinsurance arrangements that already  
5 exist in the OneBeacon runoff entities. These  
6 third-party reinsurances represent literally hundreds  
7 of millions of dollars in protection from some of the  
8 world's largest reinsurers, even before taking into  
9 account the well-documented and discussed NICO and Gen  
10 Recovers. These third-party reinsurances provide  
11 significant current and future protections over and  
12 above any capital in the entities.

13                   Importantly, while these protections may  
14 not be that apparent to policyholders, they provide  
15 very material protections which benefit policyholders.  
16 Further, the credit quality of these reinsurance  
17 obligations lies with some of the highest rated  
18 balance sheets in the insurance industry globally.  
19 The nature, detail and impact of these reinsurance  
20 protections has been previously disclosed to the  
21 Department in numerous previous filings.

22                   The next item taken in turn, what is  
23 Trebuchet's intent or plan for the OneBeacon runoff  
24 entities. First and foremost, I'd like to point out  
25 that absent the change of shareholding, one of the key

1 components of the proposed transaction is continuity  
2 in the servicing of the claims and the operations of  
3 the entities. As described on page four of the  
4 handout, there is already in place a dedicated team of  
5 professionals servicing the OneBeacon runoff, and the  
6 proposed transaction will ensure that this same group  
7 of professionals be transferred to a Trebuchet  
8 affiliate and that they will continue to have  
9 responsibility for the day-to-day management of the  
10 net claims portfolio post-closing, subject always to  
11 the supervision and oversight of the seasoned runoff  
12 professionals in Trebuchet and its affiliates.

13                   It is expected that the integration of  
14 this team will utilize an existing U.S.-based  
15 Trebuchet affiliate, which already has existing  
16 offices and staff in Pennsylvania, thus ensuring as  
17 smooth a transition as possible. Integration of the  
18 runoff into existing operations gives rise to large  
19 potential cost efficiencies which will ultimately  
20 significantly benefit policyholders of the runoff.  
21 Every dollar of expense savings will equate to a  
22 dollar available as capital to support policyholder  
23 liabilities. A significant amount of time and effort  
24 on the part of both OneBeacon and Armor has already  
25 gone into the transition in related issues so as to

1 ensure as smooth a transition as possible should the  
2 transaction be completed.

3           The experience of the professionals at  
4 Trebuchet and its affiliates also brings added  
5 measures of focus and direction, while maintaining the  
6 continuity as discussed. It is clear from any  
7 historical review of runoff portfolios that a focused  
8 approach on runoff claims ensures better outcomes of  
9 the liabilities, thus preserving capital and  
10 benefiting all the policyholders. Continuity will  
11 also apply to the pre-existing claims servicing  
12 arrangements which will be made to Berkshire Hathaway  
13 affiliates, which are unrelated to either OneBeacon or  
14 to Armor, and which arrangements will remain in place  
15 together with oversight by Trebuchet's expertise and  
16 people. This will provide overall strength,  
17 continuity and focus, which is important to certain  
18 claims issues in the runoff of the OneBeacon entities.

19           Turning to page five of the handout, who  
20 is Armor Group. Armor Group's a Bermuda headquartered  
21 group of companies focused on niche opportunities in  
22 the insurance and reinsurance markets, including  
23 runoff opportunities. For those of you unfamiliar  
24 with Bermuda as a jurisdiction, it is usually seen by  
25 most commentators as representing one of the largest

1 and most respected reinsurance marketplaces in the  
2 world. Armor Group is 100 percent privately held by  
3 its management. And its operations include the  
4 ownership and/or operational control of licensed  
5 insurance and reinsurance companies in multiple  
6 jurisdictions globally, including an existing  
7 Pennsylvania licensed entity.

8           Armor Group's management is fairly  
9 broad-based and in the aggregate represents hundreds  
10 of years of industry experience. This experience  
11 includes the completion of acquisitions, including ---  
12 or totaling billions of dollars of assets and  
13 liabilities, and Armor Group and its inaffiliates ---  
14 and its affiliates currently manage in excess of 1.3  
15 billion U.S. dollars in insurance liabilities with  
16 this figure increasing to beyond \$2 billion if you  
17 take into account pending transactions, without  
18 including the current transaction we're here talking  
19 about today.

20           Slide six of the handout contains brief  
21 bios of some of the senior management team of Armor  
22 Group. And you'll see from the descriptions that  
23 Armor's management brings a wealth of experience to  
24 the table, and that they have all been operating in  
25 highly regulated insurance and reinsurance

1 marketplaces for very long periods of time.  
2 Importantly, this experience includes the business  
3 lines which form the basis of the OneBeacon runoff  
4 portfolios.

5                   In addition to the wealth of people  
6 resources available within Armor, it should also be  
7 noted that although privately held, Armor Group also  
8 has extensive industry and capital market contacts  
9 which enable it to source significant additional  
10 capital when required as part of its business. Armor  
11 Group currently provides exclusive third-party  
12 advisory services to dedicated capital entities  
13 currently in excess of \$150 million and growing.

14                   Lastly and perhaps most importantly, is  
15 that Armor is justifiably proud of its reputation in  
16 the insurance industry and its reputation with  
17 regulators in the industry. Armor and its team has  
18 had previous dealings related to runoff within the  
19 State of Pennsylvania and filed detailed strategic and  
20 financial information on its operations within the  
21 Pennsylvania Insurance Department. It has done all of  
22 this over a multi-year period of time. Unlike the  
23 sometimes poorly informed commentators with little if  
24 any experience with Trebuchet and Armor and almost no  
25 knowledge of either Trebuchet or Armor, the

1 Pennsylvania Insurance Department is in a good, if not  
2 the best, position to make judgments concerning the  
3 expertise, integrity, financial standing and character  
4 of the Armor Group.

5           Turning to the final page, why approve  
6 the sale of Trebuchet. To make a final brief bullet  
7 points concerning the request for approval by the  
8 Department, firstly, Trebuchet and its affiliates have  
9 demonstrable expertise in completing acquisitions of  
10 runoff portfolios. Second, Trebuchet and its  
11 affiliates have demonstrable expertise in the  
12 efficient servicing of runoff portfolios and  
13 administered such portfolios in conformance with all  
14 regulatory requirements, resulting in tangible  
15 policyholder benefits.

16           Thirdly, Trebuchet and its affiliates  
17 have existing Pennsylvania operations which will add  
18 to the smooth transition of people in systems, and  
19 importantly, ensure the capture of significant  
20 potential cost efficiencies, while continuing existing  
21 service levels, again all to the benefit of  
22 policyholders. Fourthly, as has previously been  
23 discussed by the OneBeacon presentations and the more  
24 detailed presentation review by Towers Watson, we  
25 believe that Trebuchet will have the necessary amount

1 of assets and dedicated capital at closing available  
2 to acquire the OneBeacon runoff entities, and the  
3 proposed balance sheets are consistent with the proper  
4 management of the OneBeacon runoff entities as they  
5 continue to run off.

6           And finally, unlike the most poorly  
7 informed commentators with little if any experience  
8 with Trebuchet and Armor, we believe that the  
9 Pennsylvania Insurance Department is well-equipped  
10 with the experience and information and previous  
11 interaction with Armor and its people to make  
12 necessary judgments concerning the expertise,  
13 integrity, financial standing and character of Armor  
14 and Trebuchet, its people and subsidiaries. Thank you  
15 for your time.

16           MR. JOHNSON:

17           Thank you. At this time we'll switch  
18 seats again and bring up the Department's consultants,  
19 Risk & Regulatory Consultants, LLC, to give us a  
20 summary of the services and --- they provided the  
21 Department, and their conclusions.

22           MR. MOORE:

23           Good morning. My name is Craig Moore  
24 and I'm a partner in the firm of Risk & Regulatory  
25 Consulting, LLC, or RRC. I'm the partner in charge of

1 this engagement and am ultimately for the delivery of  
2 the final results of our review to the Pennsylvania  
3 Insurance Department.

4           RRC is a national professional services  
5 firm dedicated to providing regulatory consulting  
6 services to state insurance departments, including  
7 actuarial services, as well as services related to  
8 financial examinations, market conduct examinations,  
9 insolvencies and receiverships, investment analysis  
10 and reinsurance expertise. RRC's actuarial team  
11 includes qualified property and casualty actuaries,  
12 with significant expertise in reserve analysis of  
13 asbestos and environmental, or A&E for short, Workers'  
14 Compensation and other property casualty lines of  
15 business. I will be speaking today about the overall  
16 scope of our engagement with the Department, as well  
17 as the general nature of our conclusions. In a few  
18 moments I will turn over our presentation to Michael  
19 Dubin, senior consulting actuary with RRC, who will  
20 describe in a little more detail the approach taken in  
21 our review of the Towers Watson reports.

22           Our comments today are taken from our  
23 summary reports, both dated June 20th, 2014, which  
24 contain more detail than we plan to present today and  
25 have been made part of the public record. The two

1 reports referenced are titled as follows: first,  
2 Report on Review of OneBeacon Insurance Group, LLC,  
3 Analysis of Unpaid Loss and LAE as of September 30th,  
4 2012, December 31st, 2012 and March 31st, 2013, as  
5 prepared by Towers Watson. And second, Report on  
6 Actuarial Review of OneBeacon Insurance Group, LLC,  
7 Stochastic Modeling of Runoff Business Pro Forma  
8 Balance Sheet, as also prepared by Towers Watson.

9           First, I would like to cover the scope  
10 of our engagement. RRC was engaged by the  
11 Pennsylvania Insurance Department to provide actuarial  
12 support in the review of Armor's Form A Filing and  
13 related materials regarding the acquisition of control  
14 of what is referred to as the runoff companies. As  
15 has been covered in previous presentations today, the  
16 runoff companies include OneBeacon Insurance Company,  
17 Potomac Insurance Company, OneBeacon America Insurance  
18 Company and the Employers' Fire Insurance Company, all  
19 of which are Pennsylvania domestic insurers.

20           RRC's primary function was to advise the  
21 Department as to the reasonableness of the assumptions  
22 and analyses in both of the Towers Watson's reports,  
23 ultimately assisting the Department in its objective  
24 of determining whether or not the runoff companies, at  
25 the time of and following the acquisition by Armor,

1 contains sufficient assets and sufficient liquidity to  
2 pay out on a timely basis all amounts due to  
3 policyholders and claimants.

4                   The scope of the overall engagement  
5 involved two primary tasks. First was to review and  
6 analyze Towers Watson's analysis of unpaid loss and  
7 LAE of the runoff companies, which I will refer to as  
8 the reserve report, and secondly, analyze Towers  
9 Watson's stochastic scenario modeling on projected  
10 runoff outcomes under a large number of independent  
11 projection scenarios, which I will refer to as the  
12 stochastic model report.

13                   We did not perform independent actuarial  
14 calculations as a part of our engagement, but were  
15 engaged to understand the methodologies employed by  
16 Towers and the reasonableness of their conclusions.  
17 The two Towers reports are closely related. The  
18 stochastic model report uses the actuarial central  
19 estimates of the reserve report rolled forward to June  
20 30th of 2014 and expected payment patterns from the  
21 reserve report as the basis for modeling expected  
22 ultimate payments.

23                   I will now break out our primary  
24 conclusions from the work performed into two separate  
25 buckets, one for each of the two Towers reports. For

1 the Towers reserve report, we found that the actuarial  
2 central estimates of ultimate losses utilized  
3 actuarial methodologies that are generally accepted  
4 and appropriately applied. While our actuaries found  
5 that the reserves in the reserve report were  
6 considered to be a reliable central estimate, they  
7 recognized that Towers' high reasonable estimates are  
8 not meant to encompass all adverse scenarios which  
9 might befall the runoff companies. Actuarial  
10 estimates related to A&E generally contain more  
11 inherent uncertainty than other property casualty  
12 lines. Accordingly, Towers included in its reserve  
13 report numerous caveats, with which RRC concurs,  
14 concerning the inherent uncertainty of quantifying  
15 ultimate A&E losses, which make up a significant  
16 portion of the overall reserves of the runoff  
17 companies.

18           As noted in our analysis of the reserve  
19 report, Towers' ground-up reserve study was conducted  
20 using data as old as September 30th, 2012. These  
21 results were rolled forward to March 30th, 2013, for  
22 the purposes of the Towers reserve report by adjusting  
23 for actual emerged losses through that date. In  
24 addition, the losses have also been rolled forward to  
25 September 30th of 2013 using actual emerged losses

1 through that date, and then to June 30th of 2014 as  
2 inputs for the stochastic model. This was  
3 accomplished by adjusting from losses expected to  
4 emerge between September of 2013 and June of 2014.

5           We reviewed the roll forward process and  
6 found it to be appropriately performed. Although we  
7 concluded that some risk of undetected adverse  
8 development exists in relying on older data, we note  
9 that OneBeacon itself performs actuarial reviews of  
10 its data each year, and that we determined that the  
11 data was adequate for use in the stochastic model  
12 process.

13           For our review of the stochastic model  
14 report, we found that Towers' work in its conclusions  
15 regarding failure scenarios were based on accepted  
16 assumptions and methodologies, met applicable  
17 actuarial standards and practices and provided a  
18 reasonable basis for the purpose of determining  
19 whether the assets would be adequate (phonetic) under  
20 --- adequate under most circumstances to fund the  
21 obligations of the runoff companies. This included  
22 many of the significantly stressed scenarios simulated  
23 in the stochastic model report.

24           It is inherently difficult to predict  
25 future A&E loss payments because, as Towers notes in

1 its reports, events that have not occurred, legal or  
2 judicial actions for example, can affect the ultimate  
3 cost of these liabilities. It remains a risk that  
4 events not explicitly included in the model could  
5 result in the exhaustion of the runoff companies'  
6 assets before all claims are paid. But this is  
7 primarily due to the nature of A&E exposure.  
8 Consistent with Towers' use of the term, we define the  
9 words fail or failure to mean scenarios in the Towers'  
10 stochastic model report in which the modeled assets  
11 fall below zero at any point during the runoff.

12                   In its stochastic model report, Towers  
13 concluded that the collective runoff companies fail or  
14 exhaust their assets in 11.7 percent of the total  
15 10,000 scenarios modeled over a 70-year period.  
16 Conversely, this equates to a success rate of 88.3  
17 percent over 70 years. None of the failure scenarios  
18 resulted in assets reaching zero in the first ten  
19 years, and less than five percent of the total  
20 scenarios resulted in failure in the first 20 years.  
21 We concluded that the results of the Towers'  
22 stochastic model were reasonable.

23                   Now I would like to turn our  
24 presentation over to Michael to describe in some  
25 detail the process employed during our review, as well

1 as some additional detail on our conclusions from our  
2 review of the two Towers Watson reports.

3 MR. DUBIN:

4 Thank you, Craig. Good morning. My  
5 name is Michael Dubin. I will discuss the actuarial  
6 work that Risk & Regulatory Consulting performed in  
7 reviewing actuarial reports prepared by Towers Watson.  
8 I am a fellow of the Casualty Actuarial Society, a  
9 fellow of the Conference of Consulting Actuaries and a  
10 member of the American Academy of Actuaries. On  
11 behalf of clients throughout my consulting career, I  
12 have reviewed many actuarial reports containing the  
13 lines of insurance, actuarial issues and methodologies  
14 that are most relevant to this transaction, including  
15 Workers' Compensation and asbestos and environmental  
16 reserves. This actuarial review was performed by  
17 myself and Anne Kelly, who is also a fellow of the  
18 Casualty Actuarial Society and a member of the  
19 American Academy of Actuaries.

20 In general, when actuaries independently  
21 assess another actuary's work, we review the subject  
22 actuarial report and supporting documentation and then  
23 discuss it with the actuary who performed the work.  
24 Then in the role of reviewing actuary, we assess  
25 whether important aspects of the work, methodologies

1 and assumptions for example, were reasonable and  
2 whether professional standards were met. In this  
3 case, based on performing those steps, we believe that  
4 the actuarial work provided by Towers to support the  
5 Form A Filing is reasonable, as it contains reasonable  
6 conclusions, assumptions and methodologies,  
7 appropriately highlights major risk areas and meets  
8 applicable professional standards.

9           We reviewed the reports in the context  
10 of their intended use and focused on results most  
11 relevant to the objective of our review. As Craig  
12 mentioned earlier, in this case the intended use was  
13 to project a range of possible financial results and  
14 we focused on the models' projected likelihood of  
15 success. We use the word success in our report to  
16 describe the scenarios for which assets are projected  
17 to be sufficient to pay all valid claims. We did not  
18 review every number in the reports. In my  
19 presentation today, I will explain the work that RRC  
20 performed in reviewing the two actuarial reports  
21 produced by Towers, as referenced by Craig.

22           First is the reserve report. As  
23 previously mentioned, there are two major liability  
24 components reviewed by Towers in its reserve report.  
25 The first is the runoff companies' asbestos and

1 environmental liabilities, also called A&E reserves.  
2 This segment is reinsured under an adverse loss  
3 development treaty with National Indemnity Insurance  
4 Company, and is referred to as the NICO segment. The  
5 second liability segment includes traditional property  
6 casualty lines, roughly half of which is Workers'  
7 Compensation. This segment is reinsured under a  
8 separate adverse loss development treaty and is  
9 referred to as the non-NICO segment.

10           We undertook an in-depth review of  
11 Towers' work and reserve report and we found the  
12 1,700-page reserve report to be well-documented and to  
13 meet applicable actuarial standards. The approaches  
14 taken by Towers in reviewing the NICO and non-NICO  
15 segments were quite different, as would be expected,  
16 and I'll address --- I'll discuss our review for each  
17 separately.

18           Towers used proprietary exposure-based  
19 models to quantify asbestos and environmental losses  
20 in the NICO segment. These models utilized individual  
21 policyholder and claim information and were  
22 supplemented by relevant industry benchmarks. We  
23 concluded that the work done by Towers to estimate  
24 asbestos and environmental losses was thorough and  
25 that the application of the proprietary models was

1 appropriate. We did not review the underlying  
2 algorithms of the proprietary models themselves, as  
3 these are not standard actuarial methodologies. We  
4 did receive full description of these models and  
5 satisfactory answers to our questions about the  
6 models.

7                   For the pollution component of A&E,  
8 which is smaller than asbestos, the results of the  
9 Towers' proprietary model are supplemented for the  
10 standard actuarial technique, along with the commonly  
11 used metric known as survival ratio. Survival ratio  
12 is simply the reserve estimate divided by the current  
13 rate of annual claim payments. Towers' appropriately  
14 used actuarial judgment in selecting the methods to be  
15 used and in incorporating policyholder and claim  
16 information and in selecting its actuarial central  
17 estimate of NICO losses.

18                   We observe that the recent history of  
19 industry-wide upward loss development of A&E reserves  
20 has not yet abated, and believe that even with a more  
21 refined reserve --- more refined reserve estimation  
22 methods, future deterioration is a possibility.  
23 Actuarial reserve estimates related to A&E generally  
24 contain more inherent uncertainty than other property  
25 and casualty reserves. Accordingly, Towers included

1 in its reserve report numerous caveats, providing  
2 examples of the inherent uncertainty which could  
3 negatively impact the A&E reserves.

4           RRC concurs with these examples, which  
5 include new claims, new causes of action, new judicial  
6 precedents and other unforeseeable actions. Towers  
7 noted both in its reserve report and stochastic model  
8 reports that, and this is a quote, projection of A&E  
9 loss liabilities are subject to potentially large  
10 errors of estimation, since the ultimate disposition  
11 of claims incurred prior to the financial statement  
12 date, whether reported or not, is subject to the  
13 outcome of events that have not yet occurred. Towers  
14 goes on to say, any estimate of future costs is  
15 subject to the inherent limitation on one's ability to  
16 predict the aggregate course of future events,  
17 unquote.

18           The reserve roll forward calculation is  
19 a key component of the Towers' analysis because its  
20 result is an input to the stochastic model. The roll  
21 forward was provided in sufficient detail to follow  
22 the emergence of actual loss payments subsequent to  
23 the data analyzed in the report and compared to  
24 expected loss payments. Because over a year has  
25 passed without a new ground-up reserve study, we

1 questioned Towers on why they chose a roll forward  
2 approach as opposed to a new ground-up reserve study.  
3 Considering the long tail nature of the business of  
4 the reserves, the relatively short time frame covered  
5 by the roll forward calculations and the subsequent  
6 payment detail review by Towers in its roll forward  
7 work, we concluded that the resulting ultimate loss  
8 estimates were sufficiently reliable to use as inputs  
9 for the stochastic model.

10           We have confidence in the reserve report  
11 and the estimate of the runoff companies' ultimate  
12 losses, but note that it is possible that these ---  
13 that future reserve studies utilizing more recent  
14 claims history could result in a different estimate.  
15 In order to confirm our understanding of the report,  
16 we had multiple conference calls and meetings with  
17 Towers, OneBeacon and Armor. We discussed Towers'  
18 estimates of tail liability for Workers' Compensation,  
19 and believe that Towers appropriately allowed for  
20 considerable tail development.

21           Another key element we discussed in  
22 detail with Towers was the incurred but not reported  
23 reserves, or IBNR, for the NICO segment. Towers noted  
24 that the IBNR provision is intended to allow for some  
25 unforeseeable emergence of future claims. The reserve

1 report includes extensive documentation of several  
2 standard reserving methodologies using aggregate data  
3 to project 28 segments of non-NICO losses. Towers  
4 supplemented these methods with an analysis of  
5 individual claim data and made reasonable actuarial  
6 central estimates based on the results of these  
7 methods. It should be noted that approximately \$70  
8 million of the non-NICO reserves, consisting primarily  
9 of involuntary Workers' Compensation pools, were not  
10 reviewed by either Towers or RRC.

11           Throughout our review, we focused on  
12 areas and judgments which we deemed to be the most  
13 important in driving the results. The Towers report  
14 contains a great many calculations, projections,  
15 assumptions and judgments, and there is a great deal  
16 of interdependence among many of these parameters.  
17 While we might not have chosen the same parameters,  
18 methods and assumptions in all areas, we found that in  
19 the aggregate, the results were reasonable. Inflation  
20 and the impact of change in ownership are two examples  
21 of areas which we found important in reviewing Towers'  
22 work.

23           First, the inflation assumption ---  
24 assumptions used by Towers in both its reserve and  
25 stochastic models affect each model's generated asset

1 returns and loss development for both NICO and  
2 non-NICO lines. Towers has provided a reasonable  
3 array of inflation assumptions varying from two  
4 percent to eight percent, and maintains consistent  
5 assumptions for inflation within its assumed interest  
6 rates.

7                   Medical inflation in particular is a key  
8 component of both A&E and Workers' Compensation  
9 estimates. For A&E, a range of medical inflation  
10 assumptions is used based on relationships to the  
11 consumer price index, or CPI. Uncertainty is  
12 especially high for medical inflation, as evidenced by  
13 the variation in historical differences between  
14 medical inflation and CPI. Since the length of time  
15 being projected in the stochastic modeling is very  
16 long, 70 years, even a small misestimation of  
17 inflation could materially affect the results.

18                   Next, we discussed the impact of the  
19 change in ownership. When a company changes its  
20 business model and its approach to claims handling, it  
21 is probable that reserves would be impacted to some  
22 degree. Addressing the impact of ownership on claims  
23 handling and reserve calculations is a matter of  
24 professional judgment in the actuarial community.  
25 Some actuaries conclude that reserves would not be

1 impacted when a company undergoes changes such as  
2 those expected in this case, while others would  
3 reflect explicit changes in their reserve  
4 calculations. We believe that a change in company  
5 ownership has the potential to alter historical  
6 payment patterns underlying the loss reserve study.  
7 To the extent that this occurs, ultimate losses can be  
8 different from those based on historical data.

9           Next, I discuss our review of Towers'  
10 stochastic model report. The stochastic modeling  
11 results are intended to help answer the question of  
12 how likely it is that assets on the proposed balance  
13 sheet will be sufficient to pay all claims and  
14 expenses. This question is answered by examining the  
15 portion of scenarios for which the companies are able  
16 to pay all the claims before assets are exhausted.  
17 This is a particularly complicated model given the  
18 expected variability and correlations among the  
19 inputs, including the future performance of the  
20 assets.

21           There is also an element of uncertainty  
22 introduced given the fact that the models are not the  
23 only possible models that could be used. This is  
24 known as model risk, which should always be considered  
25 when models are used. Projecting ultimate losses

1 without projecting future economic conditions would  
2 not be sufficient to determine the likelihood of  
3 success, because claims are expected to be paid many  
4 years in the future. Moreover, the companies are  
5 expected to be reimbursed for NICO losses until the  
6 NICO treaty is exhausted, which could be many years  
7 from now. As a result, assumptions regarding future  
8 economic conditions such as the rate of inflation and  
9 interest rates, as well as the timing of future loss  
10 payments, particularly for the NICO segment, also play  
11 a critical part in estimating the likelihood of  
12 success. The model's results also provide useful  
13 insight about the causes of potential failures.

14           Our general approach to reviewing the  
15 stochastic model report was similar to our review of  
16 the reserve report and included an in-depth analysis  
17 of the report, as well as follow-up conversations with  
18 Towers, OneBeacon and Armor on the matters we found  
19 significant. We did not review the detail of the  
20 underlying algorithms of Towers' proprietary  
21 stochastic model, as it not a standard actuarial  
22 methodology. We did receive a full description and  
23 receive satisfactory answers to our related questions.

24           Similar to our findings regarding the  
25 reserve report, we found the stochastic model report

1 to be well-documented and to meet applicable actuarial  
2 standards. We held multiple meetings and conference  
3 calls on the stochastic model report in order to  
4 obtain further information on the selection of  
5 parameters, possible changes to the cash flow  
6 following the exhaustion of the NICO treaty, and  
7 liquidity assumptions for securities on deposit with  
8 state insurance departments.

9           In the stochastic model report, reserve  
10 variability for the non-NICO losses was estimated  
11 using a statistical technique called bootstrapping.  
12 The technique itself, as well as the parameters and  
13 assumptions used, were well-explained by Towers.  
14 Based on our review of the professional literature, as  
15 well as our own experiences, we recognized that  
16 bootstrapping can underestimate the actual variance in  
17 reserves. We questioned Towers on this point and were  
18 satisfied with their reply that they had addressed  
19 most of the issues raised in the professional  
20 literature, including inflation adjustments. We asked  
21 for and received sufficient details of the inflation  
22 --- of the adjustments made to the loss development  
23 triangles to remove the inflationary impacts.

24           In their stochastic model report, Towers  
25 Watson concluded that the collective runoff companies

1 fail or exhaust their assets in 1,172 out of 10,000  
2 scenarios, or 11.7 percent over 70 years. None of the  
3 failure scenarios resulted in assets reaching zero in  
4 the first ten years, and only 4.1 of the --- percent  
5 of the scenarios resulted in failure in the first 20  
6 years. To the extent that there may be more  
7 uncertainty or more correlation between the segments  
8 than has been modeled, the failure rate may actually  
9 be higher than 11.7 percent. According to the model  
10 output, 90.1 percent of the scenarios did not fail  
11 within the first 30 years.

12           As noted in our report, success is also  
13 tied to earning an adequate return on investments over  
14 the period of time necessary to settle all claims.  
15 Towers considered different assumptions as to starting  
16 assets, all of which are included in its stochastic  
17 model report. Towers' final version utilized a  
18 smaller percentage of total assets held in the form of  
19 equity investments than was initially considered in  
20 one of the other versions included in their report.

21           The final version of the model we  
22 reviewed assumed a maximum of 15 percent equities  
23 throughout the first 30 years. Some investment in  
24 equities, according to OneBeacon, is a key element of  
25 the transaction because much of the anticipated loss

1 payments are not expected for many years, and  
2 investment in equities is expected to produce a higher  
3 return over the long term than other investments. As  
4 a result, the final modeling has a reduced probability  
5 of failure due to poor equity performance in the  
6 initial modeling, which assumed a higher percentage of  
7 investments in equities.

8           During the course of Towers' preparing  
9 its stochastic model report, OneBeacon added an  
10 additional \$6.7 million in starting assets funded  
11 through an additional surplus note. We note that the  
12 starting balance sheet as currently proposed is more  
13 conservative than the initial version because of the  
14 additional \$6.7 million surplus note and the smaller  
15 allocation of assets to equity securities.

16           As Craig mentioned earlier, we conclude  
17 that the actuarial estimates of ultimate losses in the  
18 Towers reserve report and its stochastic model report  
19 utilize actuarial methodologies that are generally  
20 accepted and appropriately applied. In addition, we  
21 conclude that Towers' work and its conclusions  
22 regarding failure scenarios in its stochastic modeling  
23 are based on accepted assumptions and methodologies,  
24 meet applicable actuarial standards and practices, and  
25 provide a reasonable basis for determining whether the

1 assets would be adequate under most circumstances to  
2 fund the obligations of the runoff companies. Thank  
3 you.

4 MR. JOHNSON:

5 Thank you. Okay. As we go to the  
6 public comment period, I want to make sure I have the  
7 complete population on who wants to speak. So let me  
8 kind of go down the list. Let me see. So I have Paul  
9 Stockman? Okay. You might as well --- you'll be  
10 first up, so you might as well come up. Jonathan  
11 Terrell? You still want to speak? Brian Scarbrough?

12 ATTORNEY SCARBROUGH:

13 Yes.

14 MR. JOHNSON:

15 Okay.

16 OFF RECORD DISCUSSION

17 MR. JOHNSON:

18 William --- your handwriting's like  
19 mine. Green ---?

20 ATTORNEY GREANEY:

21 Yeah, it's Greaney. I actually only  
22 have to speak if these gentlemen disappoint. I  
23 think ---.

24 MR. JOHNSON:

25 Well, that's okay.

1 ATTORNEY GREANEY:

2 I don't anticipate ---.

3 MR. JOHNSON:

4 Okay.

5 ATTORNEY DAUBERT:

6 But you have to be ready. We  
7 understand.

8 MR. JOHNSON:

9 Okay. Who else is on this page? Gary  
10 Fergus?

11 MR. FERGUS:

12 Here.

13 MR. JOHNSON:

14 Okay. And Dan Healy?

15 MR. HEALY:

16 Yes, I'm here.

17 MR. JOHNSON:

18 Okay. So let me count that number. So  
19 that gives us how many people? Is there anybody else  
20 that wants to speak that I didn't do in the roll call?

21 Okay. And we'll put a place marker with  
22 you. Two, three, four, five, six --- so that's six  
23 people that want to speak, which is fine. To give you  
24 some parameters, then, with six people wanting to  
25 speak, is if you could hold your remarks to no more

1 than a half an hour. That'll give three hours of, you  
2 know, public comment. Because we still want to go  
3 through questioning, as well as the ability to come  
4 back and make some final remarks both from the public,  
5 as well as the Applicant and Seller. So does that  
6 work? Does anybody have any concerns about the time  
7 limit you have on your remarks?

8 ATTORNEY DAUBERT:

9 The other --- the other thing is you  
10 will be able to make supplementary written remarks, so  
11 this is not your entire opportunity.

12 MR. JOHNSON:

13 Right. As we said in my opening  
14 remarks, if part of your questions --- part of your  
15 comments or questions back to the Applicant, we may  
16 ask them here today. If not, the Applicant's still  
17 going to be responsible for responding to all  
18 questions asked by the public in a supplemental  
19 filing. So, you know, if there's additional questions  
20 that aren't answered today, they will be answered in  
21 the supplemental filings to this hearing. And at the  
22 conclusion of it all, I'll go --- give you kind of the  
23 outline of where we go from here with the filing as  
24 part of my closing remarks.

25 Okay. Mr. Stockman, you'll lead us off.

1                   ATTORNEY STOCKMAN:

2                   Okay. Good morning. Thank you, Mr.  
3 Johnson. I am Paul Stockman from the Pittsburgh  
4 office of McGuire Woods. I am here today representing  
5 Pennsylvania Manufacturers' Association, Associated  
6 Industries of Massachusetts, Crosby Valve, LLC, ITT  
7 Corporation, PolyOne Corporation, the Proctor & Gamble  
8 Company, United Technologies Corporation and the  
9 William Powell Company. In addition, while I do not  
10 represent proposed Interveners, Belden, Incorporated  
11 and 3M Company, they have also authorized me to speak  
12 on their behalf today.

13                   I'd like to thank the Department for  
14 convening this public hearing and for giving us an  
15 opportunity to comment on the proposed transaction and  
16 to elaborate on our objections to the transaction as  
17 it is presently structured. Before I turn to the  
18 substance of those objections, I do want to make one  
19 procedural observation --- which as we have previously  
20 stated, we do not necessarily view this as a  
21 substitute for our full participation as Interveners  
22 in the proceeding. That our ability to evaluate this  
23 proposed transaction and to comment meaningfully on it  
24 has been rather limited. Some of the most significant  
25 documents have been withheld from public scrutiny.

1 We've been unable to review the complete Form A  
2 Filing, the full Towers Watson reports or the  
3 underlying data that support Towers Watson's analyses.

4           Importantly, then we cannot use that  
5 data to perform our own analyses to test the  
6 conclusions that have been offered here today. And  
7 I'll note that even RRC has not been able to get  
8 behind the proprietary reserve analyses that support  
9 this transaction. We believe that the ability to do  
10 that is critical for our power to assess the effect of  
11 this transaction on our interests and on the interests  
12 of other policyholders. And as a result, we continue  
13 to believe that the Department should allow us to  
14 intervene. As we've made clear, we are more than  
15 happy to enter into confidentiality agreements to  
16 protect proprietary or confidential information, but  
17 we would like to have that opportunity. Also, we  
18 believe that the Department should withhold a decision  
19 on the application until we have had an opportunity to  
20 fully review and analyze all of that underlying data  
21 that is not yet available to us.

22           Turning to the substance of our  
23 comments, even the limited information that Applicants  
24 have shared to date suggests that this proposed  
25 transaction is profoundly against the public interest.

1 We view this as a transparent effort on the part of  
2 OneBeacon Insurance Group to abandon its contractual  
3 obligations to its policyholders. It would transfer  
4 ownership of the runoff entities from a healthy,  
5 profitable, well-capitalized insurer with ongoing  
6 underwritings operations and an ongoing earning stream  
7 to a thinly capitalized entity that lacks the ability  
8 to sustain the runoff as necessary through additional  
9 capital infusions if they are required.

10           Moreover, the nature and structure of  
11 the runoff operation incentivizes the runoff managers  
12 to obstruct legitimate claims. My clients have  
13 encountered that firsthand in their dealings with both  
14 OneBeacon and with other insurers, and have every  
15 reason to believe that that will continue into the  
16 future. Therefore, we urge the Department to deny the  
17 transaction as it's now proposed.

18           Much of the technical detail that  
19 underlies that conclusion has been set out in the  
20 analysis that was provided by Jonathan Terrell, and  
21 also that has been supplemented in a very helpful  
22 analysis that FTI prepared for Colgate Palmolive. Mr.  
23 Terrell, as you can see, is in the audience today and  
24 will be making remarks, and he will be prepared to  
25 respond to any questions that the Department may have

1 either today or in the future. And we would welcome  
2 and encourage the Department to pose any such  
3 questions to Mr. Terrell.

4 My overview will be more qualitative in  
5 nature, and that overview is this. The proposed  
6 transaction creates a teetering edifice built upon  
7 overly optimistic assumptions without sufficient  
8 supporting assets that will, almost certainly, in our  
9 view, lead to insolvency and leave OneBeacon's  
10 existing policyholders without the insurance coverage  
11 they paid for and on which they justifiably rely.

12 The first and most important reason this  
13 is the case is because the existing loss reserve  
14 projections are not sufficient. Because this runoff  
15 company will not have any profits from an ongoing  
16 insurance business to provide funding for legacy  
17 claims, the solvency of this runoff entity going  
18 forward will depend entirely on whether there are  
19 sufficient assets available in the form of reinsurance  
20 recoveries or capital to pay those claims. And the  
21 sufficiency of these assets in turn depends on the  
22 accuracy of future claims projections. And  
23 unfortunately, the information available to us gives  
24 us no confidence that OneBeacon's loss projections are  
25 sufficient or realistic.

1                   As an initial matter, while OneBeacon  
2 has told the Department that it, quote, is confident  
3 that it has determined the runoff companies'  
4 liabilities through sophisticated and ongoing  
5 actuarial reviews, we think it's opportune to point  
6 out that its public statements and securities filings,  
7 where misstatements have much greater consequences,  
8 don't paint nearly so sanguine a picture. In its most  
9 recent 10K, OneBeacon noted that, quote, estimating  
10 our exposure to A&E claims is subject to a high degree  
11 of uncertainty and final ultimate loss and LAE could  
12 exceed coverage available under our reinsurance  
13 arrangements.

14                   They also note that, quote, significant  
15 uncertainties, including but not limited to case law  
16 developments, medical and cleanup cost increases and  
17 industry settlement practices, limit our ability to  
18 accurately estimate ultimate liability, and we may be  
19 subject to A&E losses beyond currently estimated  
20 amounts. As a result, OneBeacon conceded that it,  
21 quote, cannot reasonably estimate at the present time  
22 loss reserve additions arising from any such future  
23 adverse loss reserve developments, and cannot be sure  
24 that allocated loss reserves plus the remaining  
25 capacity under the NICO cover and other reinsurance

1 contracts will be sufficient to cover additional  
2 liability arising from any such adverse loss reserve  
3 development.

4                   And as a result, it should come as no  
5 surprise to the Department that Towers Watson's report  
6 is equally laden with caveats and qualifications.  
7 Quote, projections of loss and LAE liabilities are  
8 subject to potentially large errors in estimation. No  
9 assurance can be given that OneBeacon's actual loss  
10 and LAE liabilities will not materially exceed the  
11 estimates contained herein. The inherent uncertainty  
12 associated with projection of loss and expense  
13 liabilities is increased when dealing with toxic torts  
14 due to the nature of these losses. The technological,  
15 judicial and political climates involving toxic torts  
16 such as asbestos and pollution continue to change and  
17 traditional actuarial methods are not optimal for  
18 projecting toxic tort liabilities.

19                   As a result, the projection of  
20 liabilities for asbestos and pollution claims is  
21 subject to great uncertainty. And in fact, I thought  
22 it was commendable of Towers Watson to point out today  
23 that they are not taking into account changes in the  
24 litigation environment, and that they are specifically  
25 abjuring any expression of opinion on the adequacy of

1 OneBeacon's reserving practices. For those of us who  
2 have lived through this world for a while, experience  
3 teaches us that these uncertainties cut in one  
4 direction only, despite OneBeacon's effort to downplay  
5 that fact.

6           The data showed that the property  
7 casualty industry as a whole and OneBeacon in  
8 particular have historically underestimated A&E  
9 exposures, often materially so, and are continually  
10 playing catch-up in an attempt to correct past  
11 mistakes. For example, the cumulative incurred losses  
12 for the property casualty industry as a whole at the  
13 end of 2012 paid claims plus existing reserves was,  
14 according to A Invest, \$75 billion. But A Invest  
15 projected the ultimate cost at that point to be \$85  
16 billion. As a result, at the end of 2012, the  
17 property casualty industry as a whole was cumulatively  
18 under-reserved by \$10 billion.

19           And as Towers Watson notes in a portion  
20 presumably of its full report that was quoted by RRC,  
21 there is a, quote, systematic bias in reserve  
22 estimating. The quote, I think, is meaningful and  
23 worth putting into the record today. The underlying  
24 sources for the development are inherently asymmetric  
25 and are more likely to result in upward development

1 than downward development. We observe that unexpected  
2 outcomes and coverage litigation or settlement  
3 negotiations are more often negative than positive.  
4 We also observe that more defendants see unexpected  
5 increases than decreases of their litigation profile.

6           Finally, discovery of new coverage  
7 limits and claim reopening are inherently  
8 unidirectional and can only move the estimated  
9 liabilities upward. OneBeacon's historical reserving  
10 process is consistent with this observation. For  
11 example, OneBeacon transferred \$955 million in  
12 existing A&E reserves to NICO in return for \$2.5  
13 billion reinsurance. But at this point, only \$198  
14 million of that two and a half billion is unexhausted  
15 on an incurred basis. This shows that OneBeacon's  
16 reserves as of 2001 on some of the same baskets of  
17 risks that it seeks to transfer here turned out to be  
18 at least \$1.347 billion too low.

19           Moreover, OneBeacon increased in its A&E  
20 reserves by 45 percent from 2005 to 2011. If you kind  
21 of poke at Towers Watson's report, it even makes clear  
22 that OneBeacon's reserving has been, to put it  
23 charitably, overly optimistic. OneBeacon's midpoint  
24 --- or Towers Watson's midpoint estimate of A&E  
25 liabilities as of the end of 2012 was \$1.239 billion.

1 But at that point, OneBeacon was only carrying \$1.162  
2 billion in reserves. And on a net basis, Towers  
3 Watson estimated \$849 million in A&E liabilities, but  
4 OneBeacon's net reserves were only \$728 million.

5           Candidly, Towers Watson's reports for  
6 their part do not alleviate our concerns about the  
7 reserve projections. And one point that I think is  
8 important to emphasize is that the Towers Watson  
9 reports, in our view, ask the wrong question. The  
10 issue here is not whether assets will fall to zero or  
11 below zero. It's whether they will fall to a point  
12 that will drive this Department to put the runoff  
13 entities into statutory insolvency because of  
14 inadequate capital.

15           Once that happens, harm to policyholders  
16 is essentially complete. At that point, any payment  
17 to policyholders gets measured in cents on the dollar  
18 and will be delayed by years. All the while, capital  
19 is being depleted by the incredible cost of insolvency  
20 proceedings. Given that the Department has been  
21 involved in reliance insolvency, I don't need to  
22 remind the Department how expensive those proceedings  
23 are.

24           Also of significant concern about Towers  
25 Watson's report is the fact that they do not take into

1 account the risk of emerging mass tort claims. But  
2 experience teaches us that there will be new areas of  
3 liability. That is a certainty, both because of the  
4 evolution of medical, environmental and toxicological  
5 knowledge, but also because of the continuing  
6 ingenuity of the plaintiffs' bar.

7           Some other points of concern. The fact  
8 that the stochastic modeling is based on the central  
9 estimate of unpaid loss and ALAE. Our view informed  
10 by experience is that the range of outcomes, as we've  
11 suggested, does not fall in a normal distribution  
12 around that central estimate, but tends to be skewed  
13 right-ward. Further, the modeling assumes certain  
14 future loss development trends that we believe are  
15 speculative at best and counterfactual in all  
16 likelihood.

17           First, they assume that the aging of the  
18 asbestos claimant population would impact medical cost  
19 inflation. But of course, as we have discussed and as  
20 I'm sure the Department knows, there are new classes  
21 of claimants emerging all the time in asbestos  
22 litigation, particularly --- recently the spouses and  
23 children of asbestos workers who are developing  
24 mesothelioma because of take-home exposures.

25           Towers Watson also assumes that

1 technological improvements will offset future price  
2 inflation for environmental remediation. But this  
3 ignores countervailing developments in the science.  
4 Two examples. First, many of the environmental sites  
5 that would be addressed through this transaction are  
6 contaminated with trichloroethylene. But just within  
7 the past few months, emerging toxicology data has  
8 suggested that there may be greater risks than once  
9 were thought to be the case. And agencies now are  
10 looking into requiring more stringent cleanup  
11 standards and possibly reopening closed sites.

12           Another example is that until very  
13 recently there was little environmental concern about  
14 the risks posed by perfluorinated compounds or MTBE.  
15 And every day we are starting to see more and more  
16 contaminants that are becoming matters of concern as  
17 toxicological understanding increases and as detection  
18 technologies enable the measurement of toxic  
19 substances in ever smaller quantities.

20           What we think is more significant is  
21 what Towers Watson has stated elsewhere. In that  
22 respect I call your attention to the Insight  
23 publication that the Future's representative for the  
24 Plan Insulation Trust submitted with their comments  
25 last night, where Towers Watson mentions the emergence

1 of more new mesothelioma claims than expected, notes  
2 that claims forecast based on current epidemiological  
3 models can understate the number of claims, that a  
4 scenario modeling future claims where industry  
5 reserves are assumed to be adequate appears, quote,  
6 intuitively unrealistic, and again reiterating the  
7 systematic low bias in the procedures that insurers  
8 use to estimate asbestos liabilities.

9           We appreciate the work that RRC has  
10 done, but nor, with due respect to them, does their  
11 review soften our view that the economics of this  
12 transaction doom OneBeacon and Potomac to insolvency  
13 and failure if the transaction goes forward as  
14 proposed. RRC concededly could not review many of the  
15 key assumptions that Towers Watson used. They could  
16 not review the underlying algorithms driving the  
17 proprietary models. They did not independently audit  
18 or verify the underlying data and were, you know, not  
19 tasked for that matter with performing independent  
20 analyses. In short, to use an analogy from trial  
21 practice, RRC's conclusions that Towers Watson used  
22 acceptable methodologies in acceptable fashion, would  
23 mean that Towers Watson's expert report gets admitted  
24 into evidence in a trial as expert evidence that  
25 satisfies the Frye and Daubert standards, but not

1 necessarily evidence that that report is credible or  
2 factual.

3                   And in fact, RRC, I think, helpfully  
4 pointed out that the acquired companies remain solvent  
5 only if certain of OneBeacon's rosy assumptions hold  
6 up. RRC points out that the NICO reinsurances  
7 projected under Towers Watson's central estimate to  
8 exhaust in 15 years, and they point out that even that  
9 estimate relies on a robust investment yield on  
10 assets, 5.92 percent, which is a rate that OneBeacon  
11 projected and that Towers Watson accepted.

12                   Here I'll point out that one ---  
13 according to OneBeacon's 10K, its average return on  
14 investments for the past three years has been 3.0  
15 percent, 4.0 percent and 3.8 percent. RRC correctly  
16 concludes that if either of these conditions, length  
17 of time assets are held or average investment yield,  
18 were to fall short, the present value of future  
19 payments would exceed the discounted liability  
20 estimates in the Towers report and additional assets  
21 could be required to meet liabilities.

22                   Now of course, the reason that my  
23 clients are here today is that there's no source for  
24 these additional assets. OneBeacon will have walked  
25 away years before. That is, after all, the whole

1 point of this transaction.

2 RRC also properly notes that the failure  
3 to project new contingencies limits the utility of the  
4 analysis. Quote, if history is any guide, it would be  
5 prudent to expect further adverse development. In  
6 short, the transaction is based precariously on  
7 inappropriately optimistic and unsubstantiated views  
8 of what the projected losses are going to be going  
9 forward. And in fact, although we are not privy to  
10 OneBeacon's reserves, we can reasonably estimate based  
11 on positions that OneBeacon has taken in negotiations  
12 and in coverage litigation, that for the proposed  
13 Intervener group alone, without considering any other  
14 policyholders, the difference between OneBeacon's view  
15 of its exposure and our view is measured in the  
16 hundreds of millions of dollars.

17 As one example. Depending on the  
18 outcome of only one coverage issue for one  
19 policyholder in our group, OneBeacon's losses could  
20 increase by \$110 million. And of course, the proposed  
21 Interveners here are only a small fraction of  
22 OneBeacon's 876 open A&E accounts. In short, we're  
23 confident that these estimates will ultimately prove  
24 to be massively understated and the policyholders and  
25 ultimately state guarantee funds will end up bearing

1 the consequences, just as they did with Reliance and  
2 Home.

3 I also want to note that even if loss  
4 reserves were adequate, that still provides little  
5 comfort. After all, you know, essentially all of the  
6 funds available to pay claims come from reinsurance.  
7 And even if we assume that NICO and Gen Re will pay a  
8 hundred percent when called upon to do so, there's  
9 still other underlying reinsurance that may not do so.  
10 According to OneBeacon's 10K, it was 39 percent  
11 reinsured for A&E exposures, not taking into account  
12 the NICO cover. If any of that underlying reinsurance  
13 is uncollectible, it hastens the exhaustion of the  
14 NICO and GEN RE reinsurance programs, but neither  
15 OneBeacon nor the Towers Watson report appear to fully  
16 recognize the risk that reinsurers will be unwilling  
17 or unable to make these payments.

18 You know, for example, in the asbestos  
19 liability context, Towers --- Towers Watson used a 7.5  
20 percent provision for uncollectible reinsurance due to  
21 reinsurance coverage disputes, a figure that OneBeacon  
22 assumed in its ceded model and that Towers Watson  
23 assumed and incorporated in its estimates. And for  
24 the non-NICO book, Towers Watson estimated its  
25 uncollectible reinsurance based principally on

1 insolvency risk. Its counterparty risk was based on  
2 the financial strength of its reinsurers, not on their  
3 unwillingness to pay. This is not realistic in our  
4 view.

5 I'd like to quote Richard Stewart, who  
6 is a former New York insurance commissioner and former  
7 NAIC President, and in fact one of the authors of the  
8 model Insurance Holding Company Act. He wrote,  
9 delayed payments means substantial additional  
10 investment income and payment reductions through  
11 litigation and compromise can be in the tens, even  
12 hundreds of millions of dollars. With such big  
13 financial benefits in view, an insurer can afford  
14 excellent counsel and a tenacious defense. As one  
15 would expect, such claims practices have spread to  
16 reinsurers. Substantial reinsurance claims end up in  
17 arbitration and litigation, which renders payment  
18 uncertain and delays it for years. Yet primary  
19 insurers continue to carry disputed reinsurance  
20 recoverable as an asset.

21 Mr. Terrell, for his part, agrees with  
22 this conclusion and also, I think helpfully, points  
23 out that a runoff operation has an overriding  
24 incentive to generate cash flow by commuting  
25 reinsurance for less than full value. So when we look

1 at the existing reserves in the reinsurance and once  
2 we conclude those are inadequate, what we're left is  
3 what --- to pay claims is what capital is left in the  
4 existing organization.

5           And the existing capital is not  
6 sufficient. As we pointed out, OneBeacon has already  
7 stripped out more than \$700 million in surplus from  
8 these companies. You know, of the capital that  
9 remains, as Mr. Terrell notes, the pro forma balance  
10 sheet improperly includes \$34 million in net deferred  
11 taxes that can never be efficiently captured or  
12 effectively captured. As FTI notes, Potomac Insurance  
13 Company's projected surplus is already approaching, if  
14 not below the level that will require Department  
15 intervention practically from day one after the  
16 transaction closes.

17           And of course, Armor Group is not able  
18 to provide the needed funds from its own resources.  
19 In the 2011 financial statement that they provided to  
20 the Department, they listed total assets of only \$9.2  
21 million. Clearly, there's no capital infusion coming  
22 from Armor Group if the existing assets of the runoff  
23 operation are inadequate. I mean, I think it's  
24 telling that the statements from Armor Group today  
25 about why the Department should approve the

1 transaction focus solely on their background and on  
2 their claims handling, not on their financial  
3 capability to pay insurance claims if reinsurance is  
4 exhausted.

5                   Now, perhaps it would be worth assuming  
6 these risks if they were necessary to ensure  
7 OneBeacon's stability as a going concern. But that's  
8 not the case here. OneBeacon's ratings are high,  
9 they're steady. There's no indication that their  
10 ability to write new business has been impacted.  
11 There's nothing to suggest they're having difficulty  
12 raising capital or that they are at risk of being  
13 placed under regulatory scrutiny. This is purely an  
14 attempted exercise at financial engineering.

15                   You know, as an aside, as OneBeacon  
16 pointed out this morning, this is supposed to be  
17 revenue neutral. But if it's correctly estimated its  
18 losses and appropriately reserved for them, it  
19 shouldn't have a financial benefit from this  
20 transaction. But if so, why do it? I mean, what that  
21 makes plain to us is that OneBeacon at some level  
22 doesn't believe the representations it's making to the  
23 Department, or at least is very worried about whether  
24 or not they will turn out to be accurate. Because if  
25 they were correct, there would be no financial reason

1 to do this.

2                   We view the justifications that  
3 OneBeacon has put forward to be blatantly contextual.  
4 We believe it's telling that OneBeacon has offered no  
5 concrete evidence to support the alleged  
6 inefficiencies or management challenges or  
7 distractions that this runoff portfolio purportedly  
8 creates. And that's because we cannot see how there  
9 could be such evidence. For more than a decade, most  
10 of this portfolio has been managed and controlled by  
11 Resolute Management as part of the reinsurance  
12 agreement with NICO. It's hard to see under those  
13 circumstances how OneBeacon could complain that the  
14 runoff portfolio challenges or distracts its  
15 management or hinders employee recruitment and  
16 retention efforts.

17                   More importantly, this will not benefit  
18 policyholders. There already is a focused team  
19 managing the runoff, Resolute Management. And as  
20 we'll point out in a moment, the runoff entity's focus  
21 on running off claims actually works to policyholders'  
22 detriment.

23                   We also think the risk from ongoing  
24 underwriting activity is nonexistent. The ongoing  
25 underwriting activity is largely short tail policies

1 that do not have the long-term risks of the existing  
2 legacy commercial union portfolio. And frankly, on an  
3 ongoing basis, the industry is excluding coverage for  
4 the most volatile of such risks. So I --- Mr. Terrell  
5 had it exactly right when he wrote that OneBeacon's  
6 proffered rationales are nothing more than a, quote,  
7 cynical and opportunistic set of justifications for  
8 restructuring, whose sole purpose is to boost  
9 OneBeacon's and White Mountain's share price at  
10 policyholder expense.

11 Now, turning from the finances to the  
12 --- and I'm almost --- I'm almost getting to the end,  
13 Steve, so you don't need to worry.

14 MR. JOHNSON:

15 Just watching the time.

16 ATTORNEY STOCKMAN:

17 That segregation of runoff claims in a  
18 separate entity with no ongoing business harms  
19 policyholders because of the incentives it creates. A  
20 runoff company's incentives are far different from the  
21 incentives that a company has if they're actively  
22 writing new business. Because a runoff company's only  
23 source of income is investment earnings, they're  
24 incentivized to hold funds longer to make more money.  
25 And as a result, they benefit from delaying and

1 obstructing even the most legitimate claims.

2           To quote Mr. Stewart again in an  
3 observation that rings true to all of us who have  
4 spent our careers representing policyholders, quote,  
5 that a troubled insurance company will get tougher on  
6 claims is not new or surprising. As long as a claim  
7 is in dispute, there is cash on hand and a loss  
8 reserve to manipulate. What is new is how widespread  
9 claim resistance has become by healthy insurers as  
10 well as troubled ones. Faced with what look like  
11 black holes of asbestos and pollution liability, many  
12 companies put up a blanket refusal to pay without a  
13 fight. Delayed payment means substantial additional  
14 investment income.

15           Mr. Stewart went on to observe that  
16 post-restructuring runoff companies are, quote, worst  
17 of all. Such insurers have no concern about customer  
18 relations because they do not write business. For the  
19 same reason, they have no restraining concerns about  
20 reputation. Their managements are sometimes awarded  
21 compensation contingent on financial results or even  
22 on there being money left when all the claims are run  
23 off. Either way, it is compensation contingent on not  
24 paying claims. This is true, of course, because a  
25 restructured runoff company of this sort that's

1 proposed to be created here, quote, has to be managed  
2 to preserve the limited assets it was given in the  
3 split. Otherwise, quote, it will not have the money  
4 to pay the contingent compensation. Give a person  
5 such strong incentives and he or she will follow them.  
6 And in that regard, the existing remedies under the  
7 law are not a suitable deterrent.

8           As you know, many states limit or  
9 preclude entirely extra-contractual remedies, and even  
10 when they're permitted, they're available only after  
11 prolonged and costly litigation. Under those  
12 circumstances, it's unreasonable to trust runoff  
13 managers to disregard their own self-interest because  
14 an inchoate risk that there may be extra-contractual  
15 liability or regulatory action down the road.

16           As a result, history tells us that these  
17 restructurings do not succeed and end badly. To  
18 assess the likely path that the acquired companies  
19 will follow if the Department approves this  
20 transaction, one need only to look to the history of  
21 the Home Insurance Company. The Home was once one of  
22 America's oldest and most venerable insurance  
23 companies, but it heavily underwrote umbrella  
24 liability coverage for industrial companies in the  
25 '60s and '70s, much like Commercial Union did, which

1 is why we're here today.

2                   As a result, by the early 1990s, the  
3 Home was heavily burdened by long tail claims and in  
4 June of 1995, Zurich acquired its renewal business,  
5 leaving the remaining long tail liabilities in the  
6 Home as a runoff vehicle. Despite the objections of  
7 policyholders and experts, the New Hampshire Insurance  
8 Department approved the transaction. This was based  
9 in part upon the opinion from Zurich's and Home's  
10 experienced executives and qualified actuaries that  
11 the remaining assets would be sufficient to pay  
12 policyholder claims for 40 years.

13                   Nonetheless, less than two years  
14 thereafter, the New Hampshire Insurance Department  
15 placed the Home under regulatory supervision. And by  
16 2003, seven years after the transaction, the Home was  
17 in liquidation and policyholders have yet to be paid  
18 more than ten years later. And so the question that  
19 we would pose to the Department is does the Department  
20 wish to preside over a similar debacle?

21                   Accordingly, we ask the Department to  
22 disapprove the proposed transaction. You know, as Ms.  
23 Phillips noted, the Department has broad authority to  
24 disapprove this transaction if the financial condition  
25 of the acquiring party might jeopardize the financial

1 stability of the insurer or prejudice the interests of  
2 its policyholders, if the plans and proposals are  
3 unfair and unreasonable and fail to confer benefit on  
4 policyholders, if it would not be in the interests of  
5 policyholders and the public to permit the acquisition  
6 or if the acquisition is likely to be hazardous or  
7 prejudicial to the insurance buying public. We ask  
8 the Department to exercise this authority and  
9 disapprove the transaction.

10           At a minimum, if the Department is  
11 inclined to approve this transaction, we believe  
12 substantial additional safeguards are necessary.  
13 These could include required additional capital. They  
14 could include required additional reinsurance. We'll  
15 note that if the existing reinsurance is indeed  
16 adequate, the additional reinsurance should be  
17 inexpensive.

18           We would propose perhaps a dividend  
19 retention plan or other sort of intracompany guarantee  
20 requiring OneBeacon --- the OneBeacon Group to keep  
21 skin in the game and to keep the runoff companies'  
22 surplus at or above an appropriate level. We'll note  
23 that this was an important component of the 1996 INA  
24 Century Indemnity transaction that the Department  
25 approved. You know, by doing that, just as Ace now

1 has an ongoing interest in the continued performance  
2 of Century, the OneBeacon Group will have a continued  
3 economic interest in the viability of the spun-off  
4 entities.

5                   And lastly, we believe that the  
6 Department would need to exercise close ongoing  
7 monitoring of the --- of any runoff company. In this  
8 respect we'll point out one thing that the Delaware  
9 Insurance Department did in the course of approving  
10 the Royal and Sun Alliance spinoff of its U.S.  
11 business. There they required the appointment of an  
12 independent claims monitor at Arrowood's expense.  
13 Finally, we would suggest that the Department adopt  
14 one of the procedures set out in the NAIC White Paper  
15 and incorporate a provision for obtaining policyholder  
16 consent as a precondition for the approval of the  
17 transaction.

18                   Thank you for the opportunity to  
19 comment. We would welcome any questions the  
20 Department has either now or later.

21                   MR. JOHNSON:

22                   I let you go a little over, but I'll ---  
23 that's okay.

24                   ATTORNEY STOCKMAN:

25                   I appreciate the indulgence.

1                   MR. JOHNSON:

2                   Just so I understand --- and all the  
3 speakers --- we understand uncertainty. Been doing  
4 this a long time. I was a author of --- one of the  
5 authors of the Century Indemnity transaction in 1996,  
6 so I understand uncertainty. But certainly, you have  
7 to understand too, that's why we had 10,000 scenarios  
8 ran, because of uncertainty. And this uncertainty  
9 goes across the whole industry, not just runoff  
10 companies.

11                   I mean, this --- A&E --- some of your  
12 comments I will say just generally, you picked on  
13 runoff companies. But go to any company. I mean,  
14 there was just an article today, A Invest, about  
15 Travelers and their litigation in a case. Whether  
16 it's an active company or a runoff company, these  
17 tactics that you describe are used by many in the  
18 industry, whether it's to hold on money or to force  
19 commutations. That's not just runoff companies. I  
20 just want you to --- in my opinion, at least to be  
21 fair, that this doesn't just go to runoff companies.

22                   ATTORNEY STOCKMAN:

23                   And we would fully agree with that. But  
24 I think the problem is when a runoff company --- when  
25 you divorce payment of claims from ongoing

1 underwriting activity, it creates two problems.

2 First ---.

3 MR. JOHNSON:

4 Let me ask you a question about that, so  
5 why don't you just hold off a second. Now, we do have  
6 a bunch of --- a few different petitions to intervene.

7 ATTORNEY DAUBERT:

8 Yes, we do.

9 MR. JOHNSON:

10 So again, we will at some point in the  
11 future, be taking some action on these requests for  
12 intervention. Just so you know. We have them, we  
13 understand them and we will be taking action sometime  
14 into the future on those requests. And I will say,  
15 too, just to be point out to be fair --- and certainly  
16 the Applicant can speak for themselves.

17 Just to point out that the risk based  
18 capital will allow those companies in runoff to be in  
19 mandatory control level, meaning they can go down to a  
20 dollar of capital under the supervision of the  
21 Insurance Department and still maintain its runoff  
22 status. So though you've talked about capital and  
23 gave kind of --- that it's not just assets, it is  
24 about assets, because the RBC law allows a company to  
25 be in mandatory control level if it's in runoff and

1 under the supervision of the Department, just to be  
2 clear what the law allows.

3           Let me --- and certainly we're --- not  
4 that --- this doesn't go to you, and you had some good  
5 comments here. But to others who speak and subsequent  
6 in any correspondence you want to give to us,  
7 generally as anybody in their research knows, in these  
8 transactions, we do --- not just Pennsylvania, but all  
9 regulators usually have a fair number of conditions as  
10 part of if they --- if we approve a transaction like  
11 this or any transaction that we approve, we certainly  
12 have the ability to add conditions. We certainly will  
13 take comment on --- give us some --- ones today, but  
14 if anybody has, not just today, but subsequent to  
15 today, has suggestions about conditions we should  
16 consider if we decide to approve the transaction.  
17 That's something good to comment to us on, because  
18 that is normal course of business. If you've seen our  
19 orders in the past, not just Pennsylvania but any of  
20 our --- my fellow regulators from around the country.

21           Let me ask you this, though. The status  
22 quo. So you're for the status quo. And that's fine,  
23 I understand that. But what I want to understand is  
24 what is your belief, is how does OneBeacon have to  
25 fund future adverse development within the runoff

1 operation? What legal requirement is there when there  
2 are separate corporate entities involved? And what is  
3 --- why do you believe the status quo could be more  
4 beneficial than the transaction itself? And it's just  
5 an open question. Knowing that --- there's no really  
6 legal requirement for OneBeacon, the holding company  
7 to fund any of its corporate entities going forward in  
8 the future.

9 ATTORNEY STOCKMAN:

10 No. And obviously, you know, we can  
11 elaborate on this in more detail. I think there are  
12 two important points to point out in that respect.  
13 First, there's reputational risk. You know, those of  
14 us who represent policyholders have seen contested  
15 claim situations all the time where the --- you know,  
16 where a contested claim is resolved because the  
17 insurer is concerned about its ongoing reputation in  
18 the industry, either with that policyholder and that  
19 policyholder's continued patronage, or with respect to  
20 the industry as a whole. Obviously some insurers are  
21 more easily swayed by that than others, but  
22 reputational risk is an important constraining factor  
23 when the runoff entity remains within the corporate  
24 family.

25 The second is, of course, there are

1 existing legal remedies that penetrate that wall of  
2 corporate separation if an ongoing company has  
3 deliberately walled off a subsidiary in an  
4 undercapitalized state and allowed it to wither on the  
5 vine. They're certainly not sure things, but that  
6 again provides a disincentive for a company who is  
7 keeping a, quote/unquote, bad bank in its corporate  
8 family, to leave that bad bank starved for assets.  
9 And I'm sure once I get a chance to ---

10 MR. JOHNSON:

11 Yes, and ---.

12 ATTORNEY STOCKMAN:

13 --- get back to the office and ---

14 MR. JOHNSON:

15 Again ---.

16 ATTORNEY STOCKMAN:

17 --- think about it more ---

18 MR. JOHNSON:

19 Right.

20 ATTORNEY STOCKMAN:

21 --- I'll come up with some other things.

22 But those are the --- those are the issues that  
23 immediately spring to mind.

24 MR. JOHNSON:

25 I would suggest to other commenters to

1 consider the concept of why the status quo is better  
2 or --- than the transaction in your remarks or  
3 subsequent, obviously. We're going to continue to  
4 take public comment, and I'll get to that in my  
5 closing remarks.

6           One of the things you said that I'm a  
7 little concerned. Since the Home --- which again, the  
8 Home goes back to the mid '90s. We're 20 years from  
9 the Home. A lot of things have changed dramatically  
10 in many respects, both regulatory and environment.  
11 But since then, I don't --- what other runoff company,  
12 pure runoff company --- because I'm not sure I'm aware  
13 of a pure runoff company that actually has been placed  
14 into liquidation up to this point in time subsequent  
15 to, you know, the early 2000s.

16           And if you have examples, it's important  
17 to point them out. But personally, and I regulate a  
18 number of runoff companies, and none of them are going  
19 under yet. And certainly within companies like the A  
20 situation with Century Indemnity hasn't gone under yet  
21 and hasn't had any more additional capital needed from  
22 its parent company under the structure that was formed  
23 back in 1996.

24           So when you make a statement like that,  
25 I would appreciate if you have some backup other than

1 the Home on pure runoffs. Please supplement your  
2 comments today, because I haven't seen a lot of these  
3 runoff companies yet --- yet. Understanding all this  
4 uncertainty. And I understand all this uncertainty.  
5 Believe me, I live it as much as you live it. It  
6 could happen in the future, but up to today I don't  
7 think there's been a lot. But you certainly can  
8 supplement there.

9 ATTORNEY STOCKMAN:

10 If you have no other questions, I'll sit  
11 down and shut up and let someone else talk. Thank you  
12 again for the opportunity to speak.

13 MR. JOHNSON:

14 Yep. Okay. Next up we'll go with,  
15 since he mentioned you a couple of times, Jonathan  
16 Terrell. Am I pronouncing your last name, or  
17 what ---?

18 MR. TERRELL:

19 Terrell's fine. I respond to that.

20 ATTORNEY DAUBERT:

21 But how do you say it?

22 MR. TERRELL:

23 Well, as you might have observed, I've  
24 got a slight English accent still after 26 years in  
25 America, and parts of my family say it both ways, so I

1 respond to both, Terrell and Terrell (changes  
2 pronunciation).

3 MR. JOHNSON:

4 Okay. Thank you.

5 MR. TERRELL:

6 Well, first part looking at my note was  
7 my name, so I think I've got that straight. I was  
8 retained to give expert advice and opinions on behalf  
9 of the same group of companies identified by Mr.  
10 Stockman in his remarks. I incorporate --- I  
11 reference the report that I filed on Monday into my  
12 remarks today. I will attempt to avoid repeating what  
13 Mr. Stockman said, though I agree with his comments  
14 and endorse them.

15 I would also like to acknowledge the  
16 expert analysis of Mr. Kaufman from FTI. He is an  
17 actuary, not an accountant. We've got lawyers here,  
18 so I'll forget the bad joke but --- so recalling of  
19 the issues was similar but different perspectives, but  
20 I very much appreciate and endorse his analysis and  
21 observations as well.

22 I'll say a couple words about my  
23 background. I've been around the issues presented in  
24 the proposed transaction my entire working life. I  
25 began work in 1984 at the accounting firm Ernst &

1 Young in London. I worked on the audit of Lloyd's  
2 syndicates as that market was beginning to come to  
3 terms with its own massive under-reserving for  
4 asbestos and environmental liabilities. Thirty (30)  
5 years later we're struggling with the same subjects,  
6 reserve adequacy for asbestos and environmental  
7 liabilities. Truly, the more things change, the more  
8 they seem to stay the same.

9           In between, I worked for six years as a  
10 senior officer of Zurich Financial Services, a  
11 subsidiary then of Risk Enterprise Management, formed  
12 to manage the runoff of the Home Insurance Company. I  
13 personally negotiated most of their largest  
14 environmental and asbestos settlements during that  
15 time period and was intimately familiar with its  
16 runoff strategy. I have therefore had firsthand  
17 experience of what may be in store for policyholders  
18 if the proposed transaction is approved.

19           Twelve (12) years ago I founded an  
20 consulting firm, KCIC, focused on providing  
21 reinsurance and risk management consulting services to  
22 policyholders. One of our consulting services is  
23 providing claims administration and reinsurance  
24 spending services to corporate asbestos defendants.  
25 We process thousands of asbestos complaints each year

1 and bill insurers under at least 50 different coverage  
2 in place agreements each month.

3 I am deeply involved in the realities on  
4 the ground of defendant companies dealing with major  
5 exposures, and also with their strategies to collect  
6 their triggered insurance assets. I am particularly  
7 knowledgeable and have expertise in insurance company  
8 restructurings, both liability based restructurings  
9 such as the proposed transaction, and loss portfolio  
10 transfers such as the many retroactive reinsurance  
11 deals with Berkshire Hathaway.

12 I have testified before the Delaware  
13 Insurance Department concerning the Royal Arrowood  
14 transaction described in my report. I gave evidence  
15 to the North Carolina Insurance Department concerning  
16 a proposed liability based restructuring for Chartis,  
17 or AIG. I've given expert testimony concerning the  
18 current credit risk associated with Century Indemnity  
19 Company, itself the subject of an LBR 15 years ago.  
20 I've also been retained as an expert witness in  
21 numerous matters concerning Berkshire Hathaway and its  
22 involvement in retroactive reinsurance deals of the  
23 very type important in the proposed transaction.

24 I'll now give a brief summary of my  
25 opinion, and as previewed by Mr. Stockman. The

1 proposed transaction is the most opportunistic and  
2 most cynical insurance company restructuring I have  
3 ever seen. I am surprised the proposal is still on  
4 the table and it has not been summarily rejected long  
5 ago.

6                   The proposed transaction is manifestly,  
7 severely prejudicial to the interests of policyholders  
8 due to a combination of several things. One, the  
9 substitution of a weak parent for a strong one. Two,  
10 inadequate capitalization by upstreaming of capital  
11 out of OneBeacon Insurance Company. Three, inadequate  
12 reserving for volatile books of business, especially  
13 asbestos and environmental. And four, an undue  
14 reliance on investment performance that is purely  
15 speculative.

16                   In addition, the proposed transaction is  
17 manifestly prejudicial to the public interest for two  
18 reasons. One, it undermines the trust in the  
19 insurance bargain, and by the insurance bargain, I  
20 mean quite obviously the premium gets paid up front.  
21 Sometime later a claim gets paid --- well, a claim is  
22 made and may be paid. And the trust in that insurance  
23 bargain is a public good. And secondly, it undermines  
24 confidence in the regulatory process to protect that  
25 insurance bargain.

1           The proposed transaction has not been  
2 reviewed in accordance with the best practices of the  
3 NAIC guidance on liability based restructurings. In  
4 particular, policyholders have not enjoyed acceptable  
5 levels of disclosure. And that White Paper recommends  
6 that in return for signing adequate confidentiality  
7 agreements, that policyholders do have access to  
8 confidential information. Secondly, policyholders  
9 have not been allowed to fully participate in the  
10 regulatory process to date, notwithstanding the  
11 welcome opportunity to comment publicly. Finally, in  
12 my opinion there is a strong likelihood of adverse  
13 consequences to regulators and guarantee funds as  
14 eventual insolvency appears inevitable. The Reliance  
15 Insurance insolvency gives a foretaste of what to  
16 expect.

17           I am now going to make several  
18 observations that I analyzed at interminable length in  
19 my report about the inability of actuaries to  
20 adequately project reserves for business especially  
21 environmental and asbestos. The history of reserving  
22 for long term liabilities by insurance companies  
23 teaches us, indeed, to disbelieve actuarial estimates.  
24 At December 31, 2001, which is the end of the year in  
25 which the White Mountain's CGM Mutual transaction took

1 place, the A&E reserves, which were summarized from  
2 note 33 of the regulatory filings on A Invest, were  
3 \$22.8 billion net for prospective reinsurance for  
4 asbestos and environmental. Industry incurred losses  
5 since through December 31, 2012, are \$44.4 billion.  
6 That's a deterioration of 195 percent. With the  
7 benefits of perfect hindsight therefore, which is a  
8 wonderful thing to have, the reserves at December 31,  
9 2001, should have been \$67.2 billion, not \$22.8  
10 billion.

11           If you go back to 1995, and I have the A  
12 Invest reports back through then, the deterioration is  
13 even more profound. Actuarial science has got  
14 reserving for these classes of claims spectacularly  
15 wrong. Actuarial science has been compared to driving  
16 a car entirely by looking in the rearview mirror. And  
17 several of the remarks we heard today are very much in  
18 reliance of looking into the future based on looking  
19 entirely in the rear view mirror.

20           OneBeacon Insurance Group also has a  
21 chronic history of under-reserving. A good place to  
22 look for this is in the difficult to understand, but  
23 informative retroactive reinsurance disclosures in  
24 Potomac Insurance Company. As we know, Potomac is the  
25 counterparty to the two retroactive reinsurance deals

1 with Berkshire Hathaway and itself reinsures other  
2 members of the OneBeacon Group. Looking at the 2002  
3 statutory regulatory filing of Potomac, we see that  
4 the initial reserves transferred under the NICO cover  
5 were \$955 million. We are informed that as of today,  
6 the unexhausted capacity in that copy is \$198.3  
7 billion. It's a \$2.5 billion cover, so by simple  
8 arithmetic we can conclude that there has been  
9 \$1,347,000,000 in adverse development since that  
10 retroactive reinsurance deal was struck, which is 131  
11 percent.

12                   A similar analysis is possible for the  
13 GLC copy legitimate cover, which is for the  
14 non-asbestos and environmental and other mass tort  
15 liabilities programming in this conversation. The  
16 initial reserves transferred under that cover  
17 identified in the 2002 Potomac statutory filing were  
18 \$170 million. Unexhausted capacity based on the 2013  
19 regulatory filing is \$8 million. And a \$170 million  
20 to recover, so again, simple arithmetic tells there's  
21 been \$392 million in adverse development cover, or 231  
22 percent, even worse than on NICO recover.

23                   I've reviewed the OneBeacon Insurance  
24 Group and OneBeacon Insurance Company financial  
25 statements going back through 2001, and for asbestos

1 and environmental, there were significant material  
2 increases in reserves in the years 2001, 2005 and  
3 2011. On a gross basis, indeed, in 2005, reserves for  
4 asbestos and environmental were increased by \$811  
5 million, which is 59 percent over the year end before.  
6 And in 2011, they were increased by \$489 million,  
7 which is 48 percent above closing reserves at the end  
8 of 2010.

9                   It's interesting to juxtapose those  
10 reserve increases with the actuarial opinions that  
11 form part of the regulatory record of the companies.  
12 And I pool those and the First Warehouse opinion from  
13 2004, the year end before this material increase, and  
14 the opinion on the file with the regulatory term at  
15 the end of 2010, the year before the 2011 increase,  
16 are both clean actuarial opinions. They give no hint  
17 whatsoever of the enormous reserve increases that are  
18 to come. And indeed, they echo the language that I've  
19 heard repeated this morning so many times. They say  
20 that the reserves have been calculated in accordance  
21 with, I paraphrase, Pennsylvania Insurance. They say  
22 that they've been computed according to established  
23 actuarial techniques.

24                   So I'm not trying to impugn the  
25 professionalism in any sense of any of the actuaries

1 involved in this. But the level of assurance of their  
2 opinions can't come to --- which are very much along  
3 the lines of okay, they did a professional job --- are  
4 not very comforting, with all due respect to the  
5 concerns of policyholders who want to know not did  
6 they do a good job, but did they get it right?  
7 There's too much at risk. And there's no reason to  
8 expect the future to be any different. A Invest has  
9 always had the White Mountain's Insurance Group in the  
10 top 10 or 15 insurers ranked by the signs of their  
11 environmental and asbestos exposures.

12                   Even at the time of the proposed  
13 transaction, and according to Towers Watson's work,  
14 OneBeacon Insurance Group appeared to be  
15 under-reserved. OneBeacon Insurance Group discloses  
16 A&E reserves close with respect to the insurance  
17 before which ultimately affects the length of cover,  
18 and in 2012 of \$1.162 billion. The range of Towers  
19 Watson as of that date is from a low of \$9.949  
20 billion, a midpoint of \$1.239 billion and a high of  
21 \$1.59 billion. So the carried reserves were  
22 significantly below even the midpoint of the Towers  
23 Watson range as of that date.

24                   Secondly, on a net basis, net  
25 prospective reinsurance, but without giving effect to

1 length of cover, net reserves at 12/31/12 were \$0.728  
2 billion and the range of the Towers Watson was \$0.707  
3 on the low end, \$0.849 on the midpoint and \$1.045 on  
4 the high point. So on net basis, they were barely  
5 above the low end of the range.

6 I won't torture you by going through the  
7 same disclosures on the non-NICO book, but they're  
8 even worse. And they're disclosed in the 10K of  
9 OneBeacon Insurance Group at the time of March 31.  
10 The carried reserves on the non-NICO book were below  
11 the low end of the Towers Watson range, and there was  
12 an immediate reserve strengthening that brought it  
13 above the low end, but nowhere near the midpoint.

14 Again with respect to Towers Watson's  
15 actuaries, there are serious concerns and flaws in  
16 their report from my perspective. First of all, they  
17 say that it's suitable for financial reporting  
18 contexts. Financial reporting --- I come at this as  
19 an accountant --- looks at financial reporting not in  
20 materiality and in particular from a prospect of  
21 users, of stockholders taking the financial statements  
22 as a whole. The situation at hand, however, is not  
23 ongoing, growing from some financial reporting. It is  
24 a risk transfer of --- a final transfer, I might add,  
25 for policyholders whose counterparty will now be in

1 all but name a completely different economic animal to  
2 the one they had. So financial reporting context, to  
3 my mind, does not give the kind of assurance that is  
4 needed by policyholders who have a material financial  
5 asset tied up with a completely different counterparty  
6 as a result of this transaction.

7 I will move through these points  
8 quickly, but again, explored at interminable length in  
9 my report. But I have concerns about the discount  
10 rate that they used and the unchallenged use of the  
11 equity returns as completed by White Mountain. I also  
12 am concerned that in the high scenario, they use high  
13 inflation and higher discount rates, because the two  
14 things really have nothing to do with each other.  
15 Inflation in the mass tort context and the  
16 environmental context really has nothing to do with  
17 inflation in the general economy.

18 I have concerns that Towers Watson notes  
19 that change in organization for the non-NICO case  
20 department, which is now moved to a so-called  
21 settlement solvency and I view that as a euphemism.  
22 And they don't really know whether payoff patterns are  
23 going to continue in the future as they have in the  
24 past, because that is a material change.

25 In their asbestos estimates, they rely

1 entirely on their proprietary model. They don't use  
2 any other benchmarks. And the survival ratio, which  
3 is an accepted --- wide-accepted technique is ignored.  
4 And A Invest in its industry report uses survival  
5 ratios and notes that White Mountain and OneBeacon  
6 Insurance Group are very significantly below industry  
7 norms. And this should be explained. The A Invest  
8 benchmark for asbestos is a survival ratio of 17. And  
9 OneBeacon Insurance Group's is well below ten. So  
10 there can be outliers, big settlements that can impact  
11 that, but I think to ignore it is unacceptable.

12                   The next point is about reinsurance, and  
13 prospective reinsurance is a very, very important  
14 asset that would be transferred in due course if the  
15 transaction is approved. And based on the 2013 10K,  
16 overall the A&E book is about 39 percent reinsured,  
17 asbestos about 38 percent, so you have more or less  
18 the same. And Towers Watson informs us that they  
19 really did no work at all on this reinsurance asset,  
20 the prospective reinsurance. They relied entirely on  
21 OneBeacon Insurance Group's own internal ---.

22 BRIEF INTERRUPTION

23 OFF RECORD DISCUSSION

24                   MR. TERRELL:

25                   And OneBeacon's own work was done in

1 2010. So 2010 work, internal OneBeacon ceded  
2 reinsurance relied on entirely by Towers Watson does  
3 not satisfy me that that asset is flexible. And I'm  
4 not talking about in terms of credit, and no  
5 reinsurance is littered with insolvency far worse than  
6 on the direct side. I'm talking about the estimates  
7 that they make, especially reinsurance.

8                   And again, my experience of sitting  
9 through weekly large and complex claim committee  
10 meetings at Zurich and the Home Insurance Company only  
11 would look at reinsurance for every one of the claims  
12 for which we're given authority tells me that there's  
13 a high degree of judgment that goes into interpreting  
14 the various coverage positions that may influence the  
15 flexibility of the insurance, not because of credit,  
16 but because of the position. And the joke goes, if  
17 you think direct insurance is tough to collect, try  
18 collecting reinsurance.

19                   And the blanket seven and a half percent  
20 allowance that they have made, to my mind, is a huge,  
21 gaping hole in the reliability of this Towers Watson  
22 report, because it's such a major aspect and so  
23 subject to coverage disputes. And they'll admit those  
24 coverage disputes are under the radar because most  
25 reinsurance disputes are settled by confidential

1 arbitrations. You don't see them in the record in the  
2 same way as you do on the direct side.

3           On the environmental, they assume that  
4 the payoff pattern is going to be based on their  
5 industry experience. But they know it already in the  
6 roll forward period that they got it wrong, and they  
7 have to change it by \$10 million because there have  
8 been a couple of large environmental settlements, even  
9 in this very short roll forward period. And the other  
10 particular concern I have is that there is no  
11 allowance at all for other new mass torts.

12           And while they have --- I have somewhat  
13 sarcastically said they've so much of their work by  
14 looking entirely in the rear view mirror. In this  
15 case they have ignored history, because what we know  
16 is that new mass torts do emerge on a regular basis,  
17 all sorts of pharmaceuticals. I've testified in many  
18 of these. Agent Orange, Fen Pen, breast implants,  
19 tainted blood and various kinds of construction  
20 defects, vibrations, hearing loss. I mean, there's  
21 all sorts.

22           There are masses of mass torts that have  
23 emerged over the time periods. And to make zero  
24 allowance for that, to my mind, is just unacceptable.  
25 In their central estimate, and that's March 31, 2013,

1 they had \$153 million for this --- for other mass  
2 torts, that's known other mass torts, not unknown  
3 ones. And even doubling that would put this new  
4 entity out of capital, just on that one assumption  
5 alone.

6                   Moving on to the really fun part now,  
7 the Towers Watson stochastic model. Everybody loves  
8 an actuary, don't they? And every problem with the  
9 first Towers Watson report on the loss reserves  
10 impacts the stochastic model as well. I'm very  
11 concerned that RRC has not had the opportunity to  
12 really delve into the mysteries of the proprietary and  
13 confidential model, and that is unacceptable to me.

14                   But in addition, there are a number of  
15 other-worldly assumptions in the model. And actually  
16 we heard afresh this morning, that the asbestos  
17 litigation environment has been improving for the last  
18 eight or nine years. And I really wonder on what  
19 planet that is true, because on this planet, and my  
20 experience working with major asbestos defendants  
21 every day, all day, is this is getting no better.  
22 It's getting worse.

23                   Secondly, the assumption about medical  
24 inflation, future asbestos being offset by the aging  
25 claimant population has no resemblance to reality on

1 the ground. For start, there's no linkage between  
2 asbestos claim settlements and medical inflation.  
3 It's a function of economics and it's a function of  
4 anticipated trial verdicts.

5           Secondly, settlement values don't do  
6 down with age. I looked at 7,000 asbestos settlements  
7 a few days ago before I finalized my report, covering  
8 the last few years. And there's no discernible trend  
9 for settlements in 50, 60, 70 or 80-year-olds when 95  
10 percent of those settlements were --- sure, a  
11 40-year-old may get paid more, but there are very few  
12 of those.

13           Multi-generational claims. Many claims  
14 are coming from children of the originally exposed  
15 defendants. Asbestos dust falling off overalls while  
16 daddy's getting changed after work type thing. We are  
17 hearing from leading pulmonologists and asbestos  
18 medicine conferences who are telling us about exciting  
19 new breakthroughs in medical science that allow  
20 detection of mesothelioma several years earlier than  
21 is current. Right now there's about 18 months between  
22 diagnosis and death. That's going to be moved up by a  
23 couple of years and add a couple of years of expensive  
24 medical intervention.

25           And finally, there's a --- many of my

1 clients are really beside themselves on this one, that  
2 the link between lung cancer and asbestos and the  
3 exposed population of lung cancer is enormous. And  
4 lung cancer being linked to asbestos exposure is  
5 something that the plaintiffs lawyers put their teeth  
6 into and is considered a huge potential liability that  
7 is just coming to the surface now.

8           The other other-worldly assumption is  
9 that environmental remediation technology would offset  
10 inflation. And sure, it's kind true in the 1990s when  
11 this was emerging, that there were huge increases in  
12 environmental science at that time. But we don't see  
13 that on the ground. I mean, even look at the GOO ---  
14 GAO report recently that is exhibited to my report.  
15 You will see that environmental costs are going up,  
16 not down.

17           I'll say a couple words about RRC. And  
18 first of all, I do very much appreciate the engagement  
19 of RRC, who are engaged by the Department on behalf of  
20 policyholders and they are on our team. But their  
21 independence is of limited value. They've undertaken  
22 no independent review of the underlying data and  
23 financial assumptions. They discussed and they  
24 questioned and they met and had conference calls. I  
25 mean, great. That's helpful, but they haven't done

1 any real independent work digging into this problem on  
2 behalf of policyholders.

3           Nevertheless, they do share many of our  
4 concerns. They many times emphasize the inherent  
5 uncertainties of forecasts, and they in particular  
6 share our concern about the payoff pattern under the  
7 NICO cover, and also this rather robust --- to quote  
8 them, robust investment yield on assets. And they  
9 note that if either of those assumptions is invalid,  
10 then the transaction potentially fails and more assets  
11 will be needed.

12           Their report on the stochastic modeling  
13 also raises significant concerns, again about the  
14 difficulty about forecasting eventual costs. They  
15 note the significant risks were not contemplated in  
16 the stochastic model. They emphasize the uncertainty  
17 about A&E reserves in the investment strategy and note  
18 that the 15 percent investment in equities is down  
19 from a high wire of 46 percent. And the fact that it  
20 even gets disclosed in this pro forma financial  
21 statement in this model for the future with even at  
22 one time contemplated 46-percent equity investment is  
23 staggeringly alarming to me.

24           As I said, the reality on the ground is  
25 that there is no end in sight. Mesothelioma cases are

1 not declining according to the epidemiological and  
2 demographic survey that was taken by Nicholson and  
3 Selikoff in the 1970s, which have informed pretty much  
4 all forecasters of asbestos. And what we're seeing is  
5 that mesothelioma claims should have peaked some years  
6 ago. But for many, many different companies, they are  
7 just stable or increasing. Secondly, values for  
8 mesothelioma are increasing. Defense costs are as  
9 high as ever. New companies are being targeted,  
10 multi-generational claims and early diagnosis, as I  
11 mentioned earlier.

12                   Moving on to the projected balance  
13 sheet, which will be in my opinion undercapitalized.  
14 I've often asked for explanation as to why these  
15 deferred tax assets has been recognized as an admitted  
16 asset on the opening balance sheet and written off the  
17 next day. I don't count it as far as I'm concerned.  
18 But adjusting for that, they have about a surplus of  
19 \$127 million, which should be contrasted with  
20 OneBeacon Insurance Company's December 31 surplus of  
21 \$866 million and put in the context of \$983 million  
22 being upstreamed from OneBeacon Insurance Company to  
23 the group over the last five years. Clearly this  
24 revision has been contemplated for a long time.

25                   Adjusting for that deferred tax asset in

1 this case this case caps the ratio at opening is 215  
2 percent. I'm noting, sir, your comments about there  
3 being negative --- no leeway for a runoff company on  
4 that leeway close to the authorized control level.  
5 Nevertheless, on any sense it's a small margin for  
6 error. And some form of regulatory involvement, even  
7 if it is not authorized control, is around the corner,  
8 to my mind, based on that opening balance sheet. And  
9 I don't think that's what anyone wants. I don't think  
10 regulators approve transactions in these kinds of  
11 circumstances because they want to be supervising  
12 something very soon. Regulators to some extent have  
13 no choice but to get involved in these situations, but  
14 this is a situation where that's not a regulatory  
15 imperative right now.

16                   Net opening reserves, net opening loss  
17 reserves. This is for full book, net of reinsurance  
18 is \$156.5 million. If you look at the combined NICO  
19 and non-NICO central estimates of Towers Watson, just  
20 add them together, you get \$2.15 million, and the  
21 highest mix around \$2.8 million. How do you get from  
22 \$2.1 billion to \$156 million? One's a big number;  
23 relatively one's a small number. And there are a lot  
24 of sets.

25                   One, there's not adequacy and I spouted

1 off a lot, and other people will, about the inherent  
2 --- the massive inherent uncertainty about reserve  
3 adequacy. Secondly, we have to do a roll forward.  
4 And we've noted already problems in the roll forward,  
5 and secondly, that one is getting out of date day by  
6 day.

7                   Thirdly, the diversification ---  
8 diversification adjustment. Well, what does that  
9 mean? It means risk does not add up in a linear  
10 fashion. As I said in my report, it's not raining  
11 everywhere all the time. So you have to allow for the  
12 fact that this doesn't add up at all. And that's  
13 fine, I don't dispute it. But as Towers Watson said,  
14 and RRC concurred, that is a matter of significant  
15 professional judgment.

16                   Ceded reinsurance. I won't even say how  
17 inadequate the work is on ceded reinsurance. But  
18 proactive reinsurance, actually in that opening  
19 reserve there's nothing, not a nickel, for the NICO  
20 coverages, the A&E. That's all completely out of the  
21 bus reserves because they are within the retroactive  
22 reinsurance cover. And when you look at the size of  
23 the gross risks in the A&E, whatever it is going on  
24 there, the potential of A&E to actually creep onto  
25 that balance sheet is, in my mind, a lot more likely

1 than Counsel for OneBeacon would have us believe. And  
2 as they said in their response to the people who I'm  
3 speaking on behalf of today, they view a 25 percent  
4 deterioration of A&E reserves to be highly unlikely.  
5 And I think I've given plenty of analysis already  
6 today as to why that's really quite likely.

7           And finally, a time value of money. And  
8 time value of money, for one, discounting reserves is  
9 not allowed under statutory or Generally Accepted  
10 Accounting Principles, except for Workmen's  
11 Compensation. So discounting any kind of asbestos and  
12 environmental is a very imprudent technique. Maybe  
13 you could argue it from an economic point of view, but  
14 in terms of regulatory analysis, a higher standard is  
15 required. And they've used speculative and optimistic  
16 analysis based on a unsupported future return on  
17 investments. And for this transaction to succeed or  
18 fail based on investment performance is putting a lot  
19 of risk on the policyholders.

20           They go on to tell us --- and this  
21 really, really amazes me. But surplus notes for  
22 start, why should this entity be burdened with  
23 interest bearing surplus notes? Why should this  
24 entity have to be paying interest? Capital should be  
25 sufficient from the get-go, but they have forecasted

1 they will start repaying surplus notes in 2018, just  
2 four years out into a massive decade runoff. And the  
3 settlement strategy, we've seen net reserves of \$156.5  
4 million, which are full cost to half in just 30 months  
5 and to quarter three years after that.

6 I mean, for start, it's unrealistic.  
7 You can't run off a book of business. But secondly,  
8 what it tells us is this so-called settlement strategy  
9 that has already been identified by Towers Watson,  
10 that it is expected that that will continue under the  
11 Armor Group, which is going to be not so much about  
12 paying valid claims as they've told you, it's going to  
13 be about commutations. And that is the first play in  
14 the runoff playbook. Commutations, finality, that's  
15 what we want.

16 But you compare this to the robust yield  
17 they're expecting on their assets, and that is why we  
18 want you to see that projecting the risk based capital  
19 ratios are going to hugely increase in the first few  
20 years, because what they're projecting is that these  
21 reserves will be paid off very quickly and in the  
22 meantime they will enjoy returns. But that's not  
23 believable assumptions.

24 Counsel for OneBeacon had offered no  
25 plausible justification for this deal. They talk

1 about complicated accounting and reporting. I mean,  
2 are we supposed to shed a tear for that? And  
3 distraction from the poor business. And we heard from  
4 the CFO this morning. He gave us two reasons why this  
5 was good for policyholders. It allows management to  
6 focus exclusively on managing the ongoing business. I  
7 mean, whoopee. What about policyholders?

8                   And secondly, it will be economically  
9 neutral. I'm sorry, I'm looking at the wrong page  
10 here. So we heard management. We've heard secondly,  
11 runoff liabilities will be separate from the ongoing  
12 liabilities. That's really not an offset. As we  
13 know, the volatility on the books that will be  
14 transferred is tremendous because we're talking about  
15 emerging claims on policies that were written decades  
16 ago. The specialty business of OneBeacon Insurance  
17 Group is a short tail book. And there is a particular  
18 uncertainty, nothing approaching uncertainty on the  
19 long tail book. And to say that policyholders will  
20 now be insulated from the ongoing liabilities is just  
21 --- it's cynical.

22                   MR. JOHNSON:

23                   Do you have much longer?

24                   MR. TERRELL:

25                   The financial --- huh?

1                   MR. JOHNSON:

2                   Because you're coming up to your half an  
3 hour here.

4                   MR. TERRELL:

5                   Okay. Can I have two more minutes?

6                   MR. JOHNSON:

7                   Two more minutes, fine.

8                   MR. TERRELL:

9                   Thank you. The financial condition of  
10 Armor cannot compare. Very limited data made  
11 available that the 2011 financial statements in the  
12 record tells of an equity of about \$6 million and they  
13 made a loss in 2011 of \$0.3 million. So we're  
14 substituting the mighty resources of OneBeacon  
15 Insurance Group for something that has a meager set of  
16 financial assembly.

17                   We heard from their CFO this morning  
18 they have access to all kinds of capital. Well, very  
19 interesting when it wasn't explained to us what  
20 capital they have available to us and why that's going  
21 to be a benefit for policyholders. In my report I  
22 explain why the economics and motivations are  
23 different in runoff, and I have that from firsthand  
24 experience of working on the Home runoff and also from  
25 dealing on the other side of the table with Equitas

1 and Kemper and many others.

2                   So finally, I would just say today if  
3 they are so confident in the sophistication of their  
4 actuarial analysis and their financial projections,  
5 they should put their money where their mouth is. And  
6 as Mr. Stockman said, if these reserve deterioration  
7 was so unlikely, get an excess policy to sit above the  
8 NICO cover. Should be pretty cheap. I'm sure they  
9 can convince Mr. Buffett that this is very small and  
10 should be cheap.

11                   Secondly, the INA transaction. I  
12 recently gave a credit opinion on that. The  
13 transaction actually succeeded. Century Indemnity is  
14 part of Ace, so they're certainly intertwined. Beyond  
15 the \$25 million surplus, they have plenty of other  
16 funds or assets that are off balance sheets that would  
17 give them potential plan and other covers.

18                   Thirdly, protection for policyholders  
19 along the lines of the Royal transaction and Arrowood.  
20 And finally, you can achieve all of management's goals  
21 without doing a spinoff of this at all. You can  
22 restructure this within OneBeacon Insurance Group and  
23 have focused management and some installation of the  
24 two sides of the business. It doesn't have to be a  
25 spinoff at all. And with that, I will rest my case.

1                   MR. JOHNSON:

2                   Okay. Well, within your oral and in  
3 your written remarks, there is a lot of issues you've  
4 raised that the Applicant and --- the Seller and the  
5 Applicant will have to be responding to, because  
6 there's a lot of points. So we'll make sure that the  
7 Applicant --- I think the Applicant sent a letter, or  
8 the Seller sent a letter. His Counsel did the other  
9 day saying they will respond to the report subsequent  
10 to the hearing. So you make a lot of good --- you  
11 make a lot of points that they need to respond to.

12                   I will say on a couple points, though,  
13 that I just want to ---. You say it's summarily been  
14 dismissed. Just so you understand how it works. We  
15 have to give all interested parties due process.  
16 Including the Applicant and the Seller here, so ---.

17                   MR. TERRELL:

18                   I speak somewhat into a passion,  
19 but ---.

20                   MR. JOHNSON:

21                   That's fine. I just want to get the  
22 record straight and you have to --- you know.

23                   MR. TERRELL:

24                   On the face of it, to my mind, this  
25 doesn't even come close.

1                   MR. JOHNSON:

2                   That's fine, but you have to give  
3 everybody their due process, so --- and I will say,  
4 too, as a person who was involved in the NAIC's White  
5 Paper, it was a White Paper. It was not a best  
6 practices. A lot of those items within the report  
7 were disputed amongst regulators, including myself at  
8 the time. So I would not couch it as a person who was  
9 on the working group that developed that paper, that  
10 it's a best practices --- it's just a White Paper,  
11 with different viewpoints from different regulators  
12 and different interested parties, just to make the  
13 record clear there.

14                   And then on the surplus note, just to  
15 make the record straight, though, that you're correct  
16 on the factual that I think 2018 they show some  
17 interest being paid. Again, just for the record, we  
18 have control as regulators on any payment of a surplus  
19 note, whether it's interest of principal, no matter  
20 what they put in the projections. 2018 comes around,  
21 we don't think they're meeting their projections if  
22 --- again, if that transaction's approved, we can deny  
23 any payment of interest and --- interest or principal  
24 forever. So just so ---.

25                   MR. TERRELL:

1 Understood.

2 MR. JOHNSON:

3 I thought you did, but I just wanted to  
4 make the record straight on those three points. Other  
5 than that, the Applicant and the Seller will be  
6 responding to your numerous issues that you've laid  
7 out in front of us today. And we appreciate that as  
8 trying to be unbiased regulators in this.

9 So we're going to take a lunch break now  
10 'til 1:30. And then we'll start with --- Brian will  
11 come up next when we get back at 1:30. So thank you.

12 SHORT BREAK TAKEN

13 MR. JOHNSON:

14 Good afternoon. We'll continue the  
15 public informational hearing with additional public  
16 comment. And we'll start with Brian.

17 ATTORNEY SCARBROUGH:

18 Good afternoon. My name is Brian  
19 Scarbrough. I'm an attorney at Jenner & Block and I  
20 am here today on behalf of Olin Corporation. Olin is  
21 a OneBeacon policyholder and Olin previously submitted  
22 a petition to intervene in this proceeding and  
23 proposed transaction, and Olin also submitted written  
24 comments last week as well. And Olin had a number ---  
25 like other policyholders who petitioned to intervene,

1 Olin had a number of procedural and substantive issues  
2 and objections, and those are laid out in its petition  
3 and the comments it submitted last week. And by  
4 participating today, Olin doesn't waive any of those  
5 objections or petitions.

6 MR. JOHNSON:

7 We've been waiting for that. Where was  
8 that earlier? Been waiting all day for that comment.

9 ATTORNEY DAUBERT:

10 We're not going to assume anyone has  
11 waived anything.

12 MR. JOHNSON:

13 Yes, thank you.

14 ATTORNEY SCARBROUGH:

15 Thank you. I don't anticipate to take  
16 nearly the 30 minutes here.

17 ATTORNEY DAUBERT:

18 Thank you.

19 ATTORNEY SCARBROUGH:

20 These will be brief remarks, so I want  
21 to make two points that Olin in particular has  
22 regarding this --- concerns that Olin has regarding  
23 the proposed transaction here. And they're points  
24 that Olin feels strongly about and strongly urges the  
25 Department to consider these.

1           The first point is a jury verdict that  
2 Olin obtained against OneBeacon last November 2013 in  
3 Federal Court in New York. Olin obtained a jury  
4 verdict against OneBeacon in a environmental coverage  
5 case regarding five environmental sites. That  
6 judgment --- well, that litigation remains pending in  
7 part to enter a judgment based on that jury verdict.  
8 And Olin claims that that verdict could result in a  
9 judgment exceeding \$60 million and potentially  
10 material more than \$60 million.

11           In addition, Olin has claims pending  
12 against OneBeacon as to the same five environmental  
13 sites, claims under Massachusetts General Law, Chapter  
14 93(a) regarding claims handling and other issues.  
15 Those are set to be tried beginning December 1st,  
16 2014, in the same federal court. And if Olin's  
17 successful on those claims, that could result in  
18 treble damages, so a total judgment could exceed \$180  
19 million and may materially exceed that amount.

20           So Olin's concern is what account  
21 OneBeacon's taken of that, that jury verdict and  
22 potential judgment, both in setting its reserves.  
23 Olin has no idea how that's factored into OneBeacon's  
24 reserves, if there's a specific case reserve set for  
25 this claim or not, and what information OneBeacon's

1 given to you, the Department, to evaluate --- help  
2 evaluate the proposed transaction and the adequacy of  
3 OneBeacon's reserves, particularly in this situation.  
4 This could be pollution related environmental clause.

5           So if the proposed transaction were  
6 approved, Olin's fears that it will be --- when it  
7 comes time to enforce its judgment, it will have to  
8 turn to Armor. And the fear is that Armor will not  
9 have sufficient capital to pay what could be a fairly  
10 substantial, multi-million dollar --- hundreds of  
11 million dollar judgment.

12           Another concern that's been raised by  
13 the policyholders that Olin also has is, as pointed  
14 out by RRC, in \$10 million pollution reserve increase  
15 that OneBeacon took and the nine months ended in  
16 September 2013. That's not Olin related to our  
17 knowledge, and it's a sizeable increase, eight to ten  
18 percent over OneBeacon's central reserve estimates.  
19 Now Olin has a jury verdict that could well result in  
20 judgment many times that \$10 million, and it has  
21 concerns that nothing's been disclosed --- or to the  
22 public about how OneBeacon has factored in that  
23 central judgment.

24           The second point I wanted to make  
25 briefly was the impact of new legal developments or

1 judicial precedents on the adequacy of setting  
2 reserves, particularly in this case, environmental and  
3 pollution reserves. So Olin's been in coverage  
4 litigation for a long time in New York and OneBeacon's  
5 been part of that for quite a while. Olin has  
6 obtained some favorable rulings recently, again ---  
7 recently on a general liability policy language,  
8 including language that shows up in OneBeacon policies  
9 that OneBeacon issued full. In particular, the  
10 rulings both from a federal court in New York, the  
11 Southern District of New York, and affirmed by the  
12 United States Court of Appeals through the Second  
13 Circuit deals with a provision that, for shorthand, is  
14 offering for to ask a continuing coverage provision.

15                   And very, very briefly, what this ---  
16 what these rulings permit Olin to do is when it's  
17 seeking coverage, for example, property damage from  
18 environmental losses from pollution or contamination,  
19 it can seek coverage not only for property damage that  
20 took place in the actual policy year that that insurer  
21 issued the policy for, but also property damage that  
22 continued on after the policy period into later years  
23 and sort of sweep that back into the policy year that  
24 was issued.

25                   It's important, vis à vis OneBeacon,

1 because OneBeacon issued to Olin several general  
2 liability policies, accepting a very low excess player  
3 in the 1970 year with no pollution exclusions. And  
4 policies issued to Olin in later years do have  
5 pollution exclusions. So what the continuing coverage  
6 provision permits Olin to do is to seek coverage from  
7 OneBeacon not just for property damage that happened  
8 in 1970, but also that continued in the years and  
9 decades, even multiple decades after 1970. And that's  
10 materially an increase in OneBeacon's exposure and  
11 liability pool.

12                   That's a new development that happened  
13 in the past couple years, and that's something that we  
14 hadn't seen before in the case law. And it raises  
15 concerns with Olin because there's no indication what  
16 consideration OneBeacon's taken of that in setting its  
17 reserves or what it's disclosed to you in terms of  
18 evaluating the adequacy of its reserves.

19                   That's the type of new legal development  
20 that RRC has said and they reiterated today, and  
21 Towers Watson has said, make it extremely hard to  
22 adequately set reserves for these types of claims.  
23 And it's something that should seriously be --- we  
24 submit should be seriously looked at and considered in  
25 evaluating OneBeacon's reserves here. And it's not

1 just an Olin issue. This continuing coverage  
2 provision language is standard form language, at least  
3 in the '60s and '70s in general liability policies.  
4 So there could well be many other policyholder ---  
5 OneBeacon policyholders that have this language.

6           And it raises an issue with us on what  
7 account OneBeacon's taken not just of their increased  
8 liability exposure to Olin, but to actually hundreds  
9 of other policyholders that have that and what it's  
10 presented to you, the Department. So Olin, along with  
11 a lot of other policyholders, doesn't want to find out  
12 for the first time, if this transaction's approved,  
13 that OneBeacon did not adequately take account of this  
14 new legal development and doesn't have the reserves  
15 adequately set when it comes time to pay these sorts  
16 of claims.

17           So those are the two points I wanted to  
18 make. I hope you will seriously consider both of  
19 those and that you will seriously evaluate the  
20 petitions we filed and the written submissions we  
21 made. And thank you for the opportunity to speak.

22                           MR. JOHNSON:

23                           Thank you.

24                           ATTORNEY DAUBERT:

25                           Thank you.

1                   MR. JOHNSON:

2                   Gary Fergus?

3                   ATTORNEY FERGUS:

4                   Thank you. My name is Gary Fergus,  
5 Attorney. I'm appointed by the Court in the Northern  
6 District of California to represent the retired  
7 Honorable Charles Renfrew. He's a former --- he's  
8 retired, former United States District Court Judge,  
9 and the former Deputy Attorney General of the United  
10 States. He has been appointed by that Court to  
11 represent future claimants in the Plant bankruptcy.  
12 In the Plant bankruptcy, OneBeacon companies insured  
13 Plant during key years, '65 to '73, with primary  
14 insurance policies, with high levels of coverage.

15                   Now, I will join in the comments made by  
16 previous policyholder speakers, and perhaps I'll plead  
17 to take up the rest of the time of the prior speaker  
18 so that I can have more than my 30 minutes, but ---

19                   ATTORNEY DAUBERT:

20                   No, no, no.

21                   ATTORNEY FERGUS:

22                   --- perhaps not.

23                   MR. JOHNSON:

24                   No, we got to be fair.

25                   ATTORNEY FERGUS:

1           One of the things that I expected to  
2 hear and hoped to hear today in the testimony from the  
3 expert witnesses is that we have done this before, we  
4 know how to get the reserves correct, we've done it  
5 right. In fact, we have over-reserved using our  
6 models, and in fact, there was too much money put  
7 aside. But that's not what we heard today. In fact,  
8 what we heard is ---. Well, you'd think OneBeacon ---  
9 very experienced insurance company. You would think  
10 they would put a stake in the ground and say, we have  
11 a reasonable belief that our estimate of the reserves,  
12 that there's no possibility that it might --- the  
13 statutory language is might --- the financial  
14 condition might adversely impact policyholders.

15           But they didn't say that today. They  
16 didn't say it to the SEC. They said, we cannot do it  
17 and we think there's a really good chance we'll go  
18 through our reserves and we will go through our  
19 assets. So they hired Towers Watson. Towers Watson  
20 came in and they said very clearly that they cannot  
21 tell you that that standard has been met. They cannot  
22 say that the reserves will be adequate.

23           What they can say is they have done  
24 10,000 iterations based on their models using their  
25 proprietary software. So Towers Watson has not been

1 able to give that opinion. RRC came in and they say,  
2 we cannot give you the estimate. We cannot tell you,  
3 and in fact, there are significant risks that there  
4 will not be enough money.

5                   Now, interestingly enough, Towers  
6 Watson, in the insight report that was described as of  
7 the end of 2012 --- it's on their website. They went  
8 through very clearly and said, guess what? The  
9 industry has been under-reserving continuously and  
10 that it is intuitively unreasonable to believe that  
11 they're adequately reserved. Now I'm speaking in very  
12 general terms.

13                   And so what so we have? We have a very  
14 detailed analysis that is done with proprietary  
15 software and RRC has said, we've looked at it  
16 actuarially and we think that those are reasonable  
17 assumptions. I call that black box reasonableness.  
18 Because if you look at it --- and that is the only  
19 thing --- I believe Deputy Commissioner Johnson, you  
20 said earlier, there's inherent risk, we all know that,  
21 we deal with it and that's why they did 10,000, 10,000  
22 various iterations.

23                   The fundamental problem, though is when  
24 you look at the evidence in this case. There is  
25 significant evidence that every single time it's been

1 wrong when there's inherent wrong, and it's always  
2 been wrong the same way, under-reserved. And so now  
3 you get to the question, well, okay, Towers Watson is  
4 --- they're very good actuaries, they have excellent  
5 credentials, they've done all these scientific things.

6           But guess what? RRC says, we've looked  
7 at the actuarial literature and guess what? It really  
8 doesn't work for this. There is a risk, and I quote,  
9 however --- page three --- based on our review of the  
10 actuarial literature, we believe the user should be  
11 cautioned that the statistical estimation of the  
12 variance that exists in a book of loss reserve is  
13 difficult to measure and may not be captured  
14 completely.

15           So one of the things that we found when  
16 we go through the report, we find that there is an  
17 analysis that's done that's called bootstrapping.  
18 Now, when I was a young lawyer, that was an argument  
19 you would make to a court when you have nothing else.  
20 I'm very pleased that it's now become part of the  
21 professional literature in the actuarial field and can  
22 be used. But that is what is being done.

23           And in particular, the --- it is not  
24 clear what epidemiological model that Towers Watson  
25 was using. If they were using Nicholson or Nicholson

1 KPMG, the epidemiological studies from the 1980s, it's  
2 well-known there were two fundamental flaws at least.  
3 One was the mortality tables they used at the time  
4 turned out not to be true. People are living longer.  
5 So that has to be taken into account. Second, it  
6 didn't take into account non-occupational exposures,  
7 the third wave.

8 I call your attention to Exhibit Two of  
9 the materials I submitted and I also brought. These  
10 were submitted yesterday electronically, but I also  
11 brought hard copies for anyone who wants them. But if  
12 you look at the report in Mealy's of --- it's  
13 basically a survey of the actuarial evidence. It  
14 says, actuarially we are guessing and underestimating  
15 the actual liability of what it is.

16 All right. So where are we? Where does  
17 that leave us with this black box reasonableness?  
18 Well, OneBeacon can't tell you. Towers can't tell  
19 you. RRC can't tell you. What Towers can say is we  
20 did 10,000, but you don't know where they started.  
21 You don't know --- if you start a journey in the wrong  
22 place and you do 10,000 variations on it, that is a  
23 problem, especially in a public process. There should  
24 be no black box reasonableness for the Commission to  
25 make a decision as important in this case as it is to

1 all the policyholders, in particular, the 7,000 people  
2 that my client is a fiduciary for. It's going to be  
3 looking for these policies.

4                   And so if what's going to be said ---  
5 because ultimately what OneBeacon is looking for is  
6 the --- and when I say stamp of approval, I mean after  
7 all of your process and everything is done, if you  
8 were to approve this, they got the stamp of approval  
9 from the Commission. It's no longer their problem;  
10 it's now onto Armor, thank you very much and we're off  
11 and running. But the policyholders and the  
12 individuals who were damaged, they don't have that  
13 option.

14                   And so it seems to me that in terms of  
15 the question well, what about the status quo? Well,  
16 the status quo is where we are, and we're stuck with  
17 it. And if they run out of money, if they do various  
18 things, then that's OneBeacon and that's what they do.  
19 And they have the consequences of that. But to  
20 basically give them a get out of the asbestos and get  
21 out of the pollution card free, as they say it's  
22 economically neutral, we do not believe is  
23 appropriate.

24                   Ironically, one of the comments that was  
25 made, opening comment is, it's just not possible to

1 estimate the reserves at the 100 percent level. Yet  
2 if you look at the Towers Watson, the very first thing  
3 they say, for the next ten years they've had no  
4 failures. Absolutely none, 100 percent success rate  
5 where they won't run out of money.

6           Given the uncertainties that are all  
7 well-known, I suggest to you that there are --- well,  
8 first of all, this application as it is currently  
9 structured should be denied. But there is --- but  
10 there are alternatives, some of which have been  
11 described by other policyholders, to basically say if  
12 this is really right, let's have some clawback, let's  
13 have some skin in the game for OneBeacon as to what is  
14 in fact in this black box.

15           Now, one of the things that was  
16 described in the public report is, well, we did some  
17 adjustments for inflation, consumer price adjustments,  
18 medical inflation, and then there's something that  
19 says litigiousness. It's a black box; you don't know  
20 what it is. You don't know how it was. You don't  
21 know what bootstrapping was done to the model, the  
22 underlying model that's being used by Towers to  
23 predict what are the reserves that are going to be  
24 needed. It's very clear. They say it many places and  
25 so does RRC. The data they're relying upon is the

1 historical data for OneBeacon. It does not take into  
2 account the other variables, the changes in  
3 mortalities, the changes in by-standards, women being  
4 exposed more, children being exposed more through  
5 secondary exposures of people who worked there.

6           So where does that leave us? We are in  
7 a situation where there are 10,000 models that were  
8 run reasonably through the standards of actuaries, and  
9 from that there are these other reasonable things  
10 done, but they're all based on black box  
11 reasonableness. Because one of the things that it  
12 would seem to me that you would want to do, is you'd  
13 want to be able to say, all right, let's try this  
14 model. Let's throw in a new mortality table, see what  
15 happens when you run one of those. Let's increase the  
16 population. Let's see how that actual model is  
17 dealing with the real life things that we are saying.

18           Now another example. Johns-Manville  
19 went through bankruptcy. There was a prediction as to  
20 how many future claims there were going to be. It was  
21 done by a gentleman by the name of Stollard. They  
22 went out, they were paying 100 cents on the dollar.  
23 They lasted, as I recall, about two years and they  
24 completely underestimated the liability. They redid  
25 it, they went down to a very low percentage, they

1 redid it again and each time they've done it they've  
2 gotten it wrong. That's the largest asbestos  
3 manufacturer and installer there ever was.

4                   And guess what? Towers Watson has been  
5 retained by the Manville Trust, because what's  
6 happened in the last two calendar years is the  
7 Manville Trust has run out of money. They stopped  
8 paying claims partway through the year because they  
9 have a cap on how much they can spend in a particular  
10 year. They've had to reduce the payment percentage  
11 that they pay to people, because they got it wrong.

12                   So now they have hired Towers Watson in  
13 the fall of last year and in the January report,  
14 financial report from the trust, they say they're  
15 still working. Okay. So that's a real live, you  
16 know, put your money where your mouth is example that  
17 Towers Watson's going to have to get it right if in  
18 fact they're doing the estimating and they are the  
19 ones who are going to determine whether or not in fact  
20 the Manville Trust is going to be able to pay the  
21 claims throughout the whole year. Well, they haven't  
22 done that.

23                   So you asked earlier on, what questions  
24 would you ask Towers Watson? I'd ask one, where have  
25 you done this that these miles that you're talking

1 about, that this bootstrapping has accurately  
2 predicted what the reserves should be. Where have you  
3 done it? And to say that it's really hard to do, to  
4 say that there is inherent risk and A&E are the  
5 toughest to do, I would think is not an adequate  
6 answer. This is one of those that what matters is  
7 getting it right if you're going to be putting  
8 together a model that says this does it. And there's  
9 no evidence that this model, that this 10,000 does it.

10                   So I go back to the might. Question is  
11 whether or not the financial condition of Armor might  
12 adversely impact the policyholder, or it might not be  
13 beneficial to them. Well, here's what RRC says.  
14 However, there are significant risks, some  
15 contemplated in the stochastic modeling and some not  
16 contemplated, that could result in the exhaustion of  
17 the runoff companies' assets before all claims were  
18 paid.

19                   Significant risks that could result. In  
20 my book, that's might. The statute doesn't say  
21 reasonably likely, more probable than not, clear and  
22 convincing evidence. The statute says might. I say,  
23 that satisfies your standard that there is evidence  
24 from your own expert that the financial condition of  
25 Armor, if this transaction goes forward, might

1 adversely affect policyholders.

2                   Second, they say, we are unable to  
3 predict the future of A&E losses. But if history is  
4 any guide, it would be prudent to expect further  
5 adverse development. If in fact there is a third wave  
6 of asbestos claims, this might well be considered a  
7 change in litigation environment not explicitly  
8 incorporated in the modeling. I submit that equals  
9 might. We're not talking about speculation. We're  
10 talking about what has happened with the development  
11 of medical and through litigation, and what's now  
12 known by science about exposure to asbestos.

13                   One thing the Commission might consider  
14 doing is waiting. See what happens when Towers Watson  
15 does their estimate for the Manville Trust and see if  
16 the Manville Trust actually is able to rely on that  
17 estimate and pay claims all through the years. That'd  
18 be the real world litmus test. But there are other  
19 conditions, I think, that if you were all inclined to  
20 grant this, that need to be done, significantly more  
21 assets, more skin in the game to protect the  
22 policyholders in order to meet that statutory  
23 standard. Do you have any questions? Thank you for  
24 your time.

25                   MR. JOHNSON:

1 Thank you.

2 ATTORNEY FERGUS:

3 Would you like the hard copies?

4 MR. JOHNSON:

5 Yeah.

6 ATTORNEY DAUBERT:

7 Thank you.

8 MR. JOHNSON:

9 Thank you.

10 MS. RANKIN:

11 Thank you.

12 MR. JOHNSON:

13 Okay. Dan? Dan Healy?

14 ATTORNEY HEALY:

15 We've prepared some slides that I was  
16 going to put up, but if you'd like me to hand them  
17 out, we can do that.

18 MR. JOHNSON:

19 Yes.

20 ATTORNEY DAUBERT:

21 Absolutely.

22 MR. JOHNSON:

23 Uh-huh (yes).

24 OFF RECORD DISCUSSION

25 MR. JOHNSON:

1           If you could at least --- the Seller and  
2 the Applicant get one, too, at least at a minimum.

3           ATTORNEY HEALY:

4           Okay. My name is Dan Healy and I'm here  
5 from Anderson Kill. I have with me --- well, with my  
6 colleague, Alexander Hardiman, also from Anderson  
7 Kill, and next to me is Allan Kauffman from FTI  
8 Consulting. He's an actuary there and has been  
9 involved previously as the actuary in the Equitas  
10 transaction.

11           Thank you for the opportunity to present  
12 public comments today. I appreciate the fact that you  
13 pointed out; there's no waiver this morning, so I  
14 won't have to go through that. But the short  
15 statement is I'm here on behalf of Colgate Palmolive  
16 and we do not consider this to be a substitute for the  
17 motion and we maintain our rights.

18           I'll preface my comments today by  
19 stating that the full information concerning this  
20 transaction has not been made available. And so while  
21 we will present information to the best of our  
22 ability, our ability is necessarily limited by the  
23 fact that we do not have all of the information that  
24 we believe is relevant and needed for policyholders to  
25 figure out what is really happening here and to assess

1 the Towers Watson and RRC reports, as well as the  
2 other information that's been filed by the Applicants.

3           And the information isn't just missing  
4 from the Towers Watson report and the RRC report.  
5 There hasn't been full information provided on the  
6 transaction details. There's not full information  
7 provided about all of the reinsurance. There are  
8 other documents in the file to the Department that  
9 have been marked as confidential. And as has been  
10 covered by many of the other speakers today, the  
11 Towers Watson reports --- report and summary and the  
12 RRC reports are made based on RRC admitting that it  
13 didn't have the information that Towers Watson had in  
14 order to perform any sort of independent analysis.

15           As you may be aware, Colgate Palmolive  
16 did actually seek a number of those documents through  
17 a Right to Know law request and was able to obtain  
18 some of them, but not all of them. Essentially  
19 OneBeacon and Armor have been very careful and very  
20 aggressive in defending the confidentiality of their  
21 information they do not want policyholders to know  
22 what it is. We think that's somewhat telling in this  
23 circumstance where they are trying to say that this is  
24 actually to the benefit of their policyholders. From  
25 the information we do have and that has been made

1 available, all indications are that the proposed  
2 acquisition that we're here about today is not in the  
3 benefit --- is not in the best interest of the  
4 policyholders and will not be to the benefit of  
5 policyholders.

6                   Now, since I think I'm the last speaker,  
7 I'll try not to repeat too much of what's already been  
8 covered, but to touch on what we think it is important  
9 and get to what we can offer that might be slightly  
10 different from the prior speakers. We think the key  
11 issue is there are obvious causes for concern, even on  
12 this complete record, are that the runoff companies  
13 are undercapitalized, they lack adequate reinsurance  
14 and that these are going to be runoff companies, and  
15 that leaves Armor as the backstop.

16                   And we haven't heard anyone today even  
17 attempt to argue that Armor will have the financial  
18 ability to make up the gap or to cover what everyone  
19 sees will be the failure of these runoff companies in  
20 the future. And we also haven't heard anyone say that  
21 these companies aren't going to fail in the future.  
22 What we really think is that issue here is how soon  
23 it's going to be. And that's based, again, just on  
24 the incomplete record. We assume that if we had more  
25 information, then that would probably paint a bleaker

1 picture for these runoff companies.

2                   So in some ways I'll try and use the  
3 slides; hopefully it makes it, if nothing else,  
4 slightly more interesting. But if we turn to the  
5 first slide titled proposed acquisition, I don't think  
6 there are any new surprises there. We think that this  
7 proposed acquisition that's going to transfer not only  
8 traditional commercial lines, but as we've heard a lot  
9 about today, asbestos and environmental exposures is  
10 not in the best interest of policyholders and is going  
11 to set up these runoff companies to fail in the  
12 future. Basically these companies will be left, as I  
13 stated, undercapitalized.

14                   Given that, we don't think that the  
15 proposed acquisition should be approved, because under  
16 the sections of the Pennsylvania statute that the  
17 Department is required to look at, this is not going  
18 to be in the best interests of policyholders. It also  
19 is going to create financial instability for these  
20 companies. I don't think OneBeacon can credibly argue  
21 based on the information that's available that that is  
22 not the case. And I'll try and go through some of  
23 that information today and lay out why we think that  
24 it is clearly against the interest of the  
25 policyholders.

1                   In looking at this, one of the things we  
2 noticed is that there is not very much analysis of the  
3 likelihood of non-payment of coverage. We think  
4 that's a major issue for policyholders, and what we  
5 haven't heard a lot about is what is the likelihood  
6 that these companies won't be able to pay, that they  
7 won't be able to pay on time. We heard earlier the  
8 definitions of failure --- I think it was the speaker  
9 from RRC --- as being zero assets, as being nothing.  
10 And you yourself were talking about the one dollar.  
11 Hopefully what we're not talking about, though, is  
12 whether or not this will result in there being one  
13 dollar left, even if that's not technically a failure.

14                   Now, the last thing is that this  
15 proposed transaction as is, we believe would not only  
16 increase the likelihood of the Department having to  
17 stay involved with these companies in regulatory  
18 oversight rule, but that it might be --- lead to a  
19 need for immediate intervention. And we think that  
20 sort of highlights the level of the problem presented  
21 by this transaction.

22                   Turn to the fifth page, slide. We  
23 believe that as proposed, this transaction will leave  
24 the runoff companies significantly less likely to be  
25 able to pay coverage on a timely basis. And paying on

1 a timely basis is very important. Even Travelers in  
2 their submission to the Department stated that Armor  
3 has a reputation for not paying on time, and that in  
4 doing so it's actually been found to be in bad faith,  
5 and that that causes material consequences for other  
6 insurance companies, let alone the actual  
7 policyholders.

8                   And so setting up a system where whether  
9 or not they've reached a technical failure, but that  
10 there is an inability to pay timely the claims that  
11 are --- or we can all just say the claims that are  
12 agreed to be payable, is a major shortcoming. And  
13 even if that isn't 30 years out, that's significantly  
14 sooner --- which we believe it is based on just the  
15 limited available information --- then this is  
16 certainly not an issue for policyholders and will lead  
17 to significant harm to policyholders.

18                   Now here in the second bullet point,  
19 you'll see at least \$200 million of additional  
20 capital. Again, and I know I've been harping on it,  
21 but that's based on incomplete information. We're not  
22 offering that as an absolute number. We see that  
23 number as probably a four based on the amount of  
24 information we have so far. We think that without at  
25 least that much more money in, based on the limited

1 amount of information from the Towers Watson report,  
2 these companies are going to be in need of immediate  
3 regulatory oversight. They're going to fall below the  
4 company action level. And the issues that may result  
5 from the timing --- I'm sorry, the issues that may  
6 result from the lack of capital and lack of  
7 reinsurance that will affect the ability to pay timely  
8 will be in the very near future.

9                   Now, part of this is that the  
10 reinsurance sources that have been referenced by  
11 OneBeacon and Armor are basically insufficient. And  
12 the NICO cover has been sort of a focus and it's  
13 becoming more of a focus, particularly with comments  
14 today. And it is simply insufficient to cover what  
15 the projected losses will be. And so we'll go through  
16 that in a little bit more detail, but that doesn't  
17 save it. And again, it doesn't make up the gap and  
18 shortfall this will have in capitalization.

19                   And again, because at this point in  
20 time, OneBeacon is looking to get rid of the runoff  
21 companies and be completely separated from them, that  
22 means it's going to be left to Armor which no one has  
23 said will ever have the ability to pay this. And from  
24 the financial records and information, they don't.  
25 They wouldn't be able to make up the shortfall.

1                   And so to the extent that down the road  
2 we'd have some other sort of hearing or proceeding  
3 before this Department, OneBeacon, I'm sure, would  
4 take the position that if this transaction goes  
5 through, they're not going to be part of it, unless  
6 there's something that's done today or as part of this  
7 acquisition, to make sure that they are part of that.  
8 And since they have the capital that's necessary and  
9 no one's sitting there saying, oh, we have to get rid  
10 of these companies because we lack capital, I think  
11 that's an important consideration for the Department.

12                   Now, turn to the next slide, which  
13 should be here somewhat. Further reasons why we  
14 believe that the proposed acquisition should not be  
15 approved is that there are major shortcomings to the  
16 Towers Watson report. It's not just simply, oh, we  
17 don't have the information they had. From our review  
18 of their reports, we believe there are major  
19 shortcomings.

20                   They didn't assess the technical  
21 insolvency, which goes to the timing issue. They, as  
22 we heard earlier, talked about failure as zero,  
23 nothing left at all. And they didn't look at what  
24 might happen before you get to the point of having  
25 nothing left at all. They also didn't test the

1 surplus adequacy. They came at this, as far as we can  
2 tell, from a cash point of view and the capital  
3 requirements were not tested.

4           But even all that aside, accepting the  
5 other features of the report, the failure rate is  
6 probably higher than 12 percent. That's sort of the  
7 best case scenario that they're able to present. And  
8 we know that the timely payments will actually happen  
9 before the 30 years at which they put that 12 percent.  
10 And even 12 percent is not exactly an ideal rate.  
11 That's where they stopped the presentation today, with  
12 their 30 years and 12 percent failure rate. They  
13 didn't go beyond that.

14           So summarizing some of the issues here  
15 before we move on to more actuarial information. Even  
16 assuming the facts as presented are all the facts,  
17 then already we know they need significant more  
18 capital. We put the number at \$200 million worth of  
19 more capital in order to be secure and to be  
20 adequately capitalized to move forward. You might  
21 say, where did we pull that number from? And we do  
22 have a reasoned approach.

23           Basically, the Towers Watson report,  
24 Potomac, which is just one of the runoff companies,  
25 had an authorized control of \$116 million. That's

1 OneBeacon's number; that's not our number. So if we  
2 just work off of the NAIC Model Act, which says two  
3 times that, and they have --- the amount would be \$232  
4 million.

5           Now, from Towers Watson's own report, it  
6 puts the entire group of runoff companies --- not just  
7 Potomac, the entire group of runoff companies, which  
8 should have a number even higher than \$232 million, at  
9 \$161.5 million. And that's where we get the  
10 conclusion that hey, from day one we're going to have  
11 a problem with these companies. And that's not like a  
12 couple million dollars. That's a pretty significant  
13 gap. So we think that is quite problematic, and  
14 that's based on the Towers Watson report and limited  
15 information we have. So without additional capital,  
16 we think that this is certainly not in the interest of  
17 policyholders. We would like to have that money paid  
18 and paid on time.

19           Also, we'll go through a chart in a few  
20 moments, but if you look at other insurance companies  
21 that have a ratio of capital to the gross liabilities,  
22 or the losses and the LAIE that are similar to what's  
23 presented in the Towers Watson report for these runoff  
24 companies, a number of them are under Department  
25 supervision already or have a grievance that are with

1 a larger insurance company structure that has adequate  
2 capital. That is the only reason they're not being  
3 subject to Department oversight. Obviously one of the  
4 things that's come up today is the Century Indemnity  
5 Company, and that would be a good example.

6 We also have some other problems with  
7 the Towers Watson report. The numbers are not exactly  
8 up to date. We heard an explanation of that earlier  
9 today that, well, based in the long term scheme of all  
10 of this, it doesn't really matter if we use last year  
11 or this year. To us, that's not an adequate  
12 explanation. Why wouldn't you use the most up-to-date  
13 information? This is not a short proceeding. This  
14 has already been going on over a year. Why wouldn't  
15 you want to have the most updated information?

16 Also, if we step back a little bit and  
17 sort of look at the overall picture in terms of the  
18 most up-to-date information, prior to the information  
19 we have today, we have a number of steps whereby  
20 OneBeacon systematically removed the capital from  
21 these runoff companies. And several of the speakers  
22 referred to some of these transactions and transfers  
23 of money between OneBeacon companies, and I --- we  
24 have --- Colgate Palmolive in its prior submissions  
25 has seen a number of these, and I'm not going to

1 belabor you with all of them today.

2           But there are some pretty significant  
3 transfers. One of the ones that has been raised a  
4 number of times by different policyholders is the  
5 extraordinary distribution of \$146 million upstream to  
6 non-runoff companies. There are other transactions  
7 where dividends were paid by runoff companies upstream  
8 to non-runoff companies in the amounts of \$65 million  
9 and --- I think there's another one for \$40 million,  
10 there's another one for \$25 million. And you can run  
11 through these; it's in the financial documents, it's  
12 been documented in submissions before the Department.

13           The point is that during the course of  
14 2012, there were a lot of these transfers where  
15 basically cash and real assets and securities in non-  
16 affiliated companies were being removed or sold by and  
17 then cash being removed from the runoff companies. In  
18 return, the runoff companies largely got stock in  
19 affiliated companies, meaning the runoff companies.  
20 And one of the more significant transfers is the --- a  
21 specialty transfer where it's basically holding  
22 roughly a billion dollars, I believe most of this  
23 involves.

24           Again, this is in the financial  
25 statements, this is public information. And that's

1 going to retransfer back if this proposed acquisition  
2 goes through. It's not going to be one of the runoff  
3 companies. I haven't sat down and done the exact  
4 math, but that's the majority, I believe, of the  
5 assets that are being held right now and it's going  
6 --- it's not going to be part of the runoff companies.

7           So what we have is over the course of  
8 2012 we have runoff companies being depleted for  
9 capital. And so looking at all of the steps of this,  
10 which I think is appropriate, that leads to many of  
11 the problems that we see today, these companies being  
12 undercapitalized. And one telling point is that I  
13 think both OBIC and OBA, all of the securities that  
14 they held in non-affiliated companies beginning of  
15 2012 --- they did not hold anymore at the end of 2012.  
16 So they basically liquidated all of those positions  
17 and only were holding affiliates.

18           Now, turning to slide nine, again, we do  
19 not believe that the proposed acquisition should be  
20 approved as it stands. And we were looking to the  
21 Towers Watson and RRC reports to answer the questions  
22 that we had pointed out in prior filings. We haven't  
23 seen those answers, and that's a major concern to us.

24           And one of the key points, though, is  
25 that really from a review of the Towers Watson report

1 --- I have in here an earnest interpretation of our  
2 --- our actuary with an honest interpretation of the  
3 Towers Watson report, is there actually is a reason  
4 not to approve this transaction. It actually  
5 establishes why you should not approve this  
6 transaction. And that we think is quite telling. It  
7 shows you why these companies truly are  
8 undercapitalized. And that's the measurement just  
9 against the normal industry standards, without getting  
10 into all of the specifics of the prior actions here.

11           I've gone through, again, some of the  
12 systematic depletion of these runoff companies that we  
13 highlight on ten. But this was in the base of  
14 statements from OneBeacon to the Department, where  
15 they said, quote, OBIG is confident and has determined  
16 that the acquired companies' or runoff companies'  
17 liabilities through sophisticated and ongoing  
18 actuarial reviews. And further, in 2012, despite the  
19 fact that they state that they've got it all figured  
20 out, they experienced over \$24 million in unfavorable  
21 losses. And so we think that their statements  
22 shouldn't necessarily be taken at face value, that  
23 there should be testament of this. And that's why we  
24 were looking to the Towers Watson report for answers,  
25 and unfortunately, we're not finding them there.

1           And again, turning to the next page,  
2 there's really no evidence of reinsurance that would  
3 be sufficient to close the gap here, financial gap.  
4 So that goes back to --- this is sort of getting to  
5 the end of my first couple points where we have  
6 undercapitalized companies and we have --- well, we've  
7 heard a lot today about how volatile and problematic  
8 predicting asbestos and environmental liabilities can  
9 be. And we've heard that over time they've largely  
10 grown and become more of a problem, and that is  
11 consistent with the fact that they shouldn't be taking  
12 capital out of these companies, leaving them with  
13 insufficient reinsurance and then transferring them to  
14 a company that doesn't have the capital to support  
15 runoff companies, which would be Potomac, which would  
16 be carrying these asbestos and environmental  
17 liabilities.

18           Another issue with the Towers Watson and  
19 RRC reports is that they largely miss the point of  
20 what a lot of people have been talking about today,  
21 which is, so what is the effect going to be on  
22 policyholders? It's simply not addressed. And not  
23 only is that a very important consideration, it's one  
24 of the considerations in the statute. And they don't  
25 address what will happen as the assets become depleted

1 over time in these runoff companies going forward.  
2 And they don't address how that will affect claim  
3 payment, and there's certainly no explanation of why  
4 it's a benefit to the policyholders.

5           So there's been no opinion on the  
6 fairness to policyholders, but also, they don't really  
7 talk about the applicable actuarial standards from  
8 ---. And because of that, the conclusions they reach  
9 aren't necessarily tied to questions that we believe  
10 the Department needs to answer. They've reached some  
11 conclusions, which is that fair and reasonable things  
12 have been done, but they haven't really talked about  
13 why, what the effect on policyholders will be and a  
14 number of other questions the Department needs to  
15 answer.

16           So again, we've been talking --- I  
17 mentioned already that we're concerned about the  
18 timely payments. Neither one of the reports provides  
19 any information that will help the Department assess  
20 whether or not these runoff companies will be able to  
21 pay claims on a timely basis. And here we mention  
22 technical insolvency, which really gets into the  
23 timely question, but I think it's also just somewhat  
24 commonsense that if what they're looking at is when  
25 you hit zero, then there may be technical insolvency

1 well before they ever get to the point that they're  
2 calling failure. And regulatory action doesn't equate  
3 until we get to the zero point, in terms of ---. And  
4 the reason for that is because we need to protect the  
5 policyholders and be involved in the management of a  
6 company that doesn't have enough capital.

7           So turn to the next slide. To summarize  
8 with regard to inadequate surplus, which is an issue  
9 here, we have a number of things I've covered, but  
10 they all go to whether or not these companies have  
11 adequate surplus, which is a major issue in looking at  
12 the appropriateness of the proposed acquisition. And  
13 Potomac alone would be subject to regulatory action.  
14 We think the other companies would as well. And they  
15 can't maintain their surplus in a RBC risk-based  
16 capital threshold, which is problematic to say the  
17 least.

18           And again, when you put the number at  
19 \$200 million --- and we believe that the failure rate,  
20 if you take into account near misses, which I'll get  
21 to, is actually more like 18 percent. And because of  
22 all of this, the 30-year projection at a 12 percent  
23 failure rate is what you get from Towers Watson. It's  
24 simply not reasonable and it doesn't have any real  
25 basis, because it's missed so many of the points it

1 needs to take into consideration to reach that  
2 conclusion.

3           Similarly, if you look at the next  
4 slide, it's some of the same types of concepts. And  
5 this is to summarize with regard to technical  
6 insolvency, and this talks about the near misses,  
7 which is failure to timely pay, even though they're  
8 not completely out of money and they may be able to  
9 pay in the future, but they aren't able to pay timely.  
10 We think that if you take into consideration the near  
11 misses on an actuarial basis, then the failure rate  
12 actually increases, based on the information we have  
13 today which we don't believe is complete, rises up to  
14 18 percent. So this would put --- this would also put  
15 the time at which the runoff companies would be  
16 insolvent well before the 30 years, which again is  
17 problematic.

18           And we prepared a chart of some of these  
19 similar --- similarly situated types of insurance  
20 companies. And the first column there that's in blue  
21 is for the runoff companies, and it sets forth a  
22 number of figures that are all straight from the  
23 Towers Watson report. These are not our figures. And  
24 you can see there that it has the gross loss as a  
25 million in reserve at \$1.185 billion. And under it

1 you have the surplus at the \$161.5 million figure that  
2 I mentioned earlier.

3           And so below that you have the various  
4 ratios. And if you look at those ratios and you go  
5 across, we've highlighted the ratios in red that we  
6 think are most relevant. And under there, as I  
7 mentioned before, the first one as you go across the  
8 page is Century Indemnity, which you mentioned earlier  
9 as well. And then there you have the entire  
10 restructuring that's had to take place. And that is  
11 under Department supervision and has been subject to  
12 regulatory action. And in place there is the dividend  
13 retention fund, which we don't have here and it hasn't  
14 been proposed.

15           And so even though that's similarly  
16 situated, what they really have is a tie-in where they  
17 do have access to additional capital. And beyond  
18 that, you mentioned earlier that you were involved in  
19 this directly and you asked about additional capital  
20 being added. And you probably have a more myriad of  
21 facts than I do, but it's my understanding that over  
22 the years --- well, starting initially and then  
23 subsequently about \$475 million has been included that  
24 was additional capital. That's from financial  
25 statements that we've been able to find. So again,

1 that's another situation where there's been additional  
2 capital provided. But we distinguish it from the  
3 proposed acquisition that we have before us today.

4           We can move on to the next column. This  
5 is a company that's in Rhode Island, the Caseatmen  
6 (phonetic) Insurance Company, and that has ratios that  
7 are --- has an 85 percent ratio of committed assets of  
8 costs recoverable. Again, it's subject to Department  
9 supervision and they are still under the supervision.  
10 And I think they have \$8.1 million surplus. So ---  
11 and they've been under supervision since 2008.

12           Also, the two other columns with the red  
13 ratios there, the AIG column with National Union,  
14 based on their public filings, AIG provides an  
15 unconditional capital maintenance agreement whereby  
16 it's going to keep the companies bundled. So even  
17 though that's not under regulatory supervision and  
18 it's not subject to regulatory action at this time,  
19 because it has basically an unconditional guarantee  
20 from its parent company, AIG, which again, we don't  
21 have being proposed here.

22           And then the last one there, which is  
23 the Indemnity Insurance Company of North America.  
24 That has an agreement whereby there's a 100 percent  
25 reinsurance agreement in place from Ace Pioneer ---

1 Ace INA. Again, that distinguishes it from the  
2 proposed acquisition we have right now. Before you  
3 had mentioned are there different ways that we might  
4 be able to address some of the problems raised by this  
5 proposed acquisition. We think these are real life  
6 examples ways in which those problems have been  
7 addressed. Notably, they all involve the company  
8 that's in the shoes of OneBeacon to remain involved in  
9 the companies, the runoff companies going forward.

10 Now, the numbers that we just ran  
11 through and that are on that chart, like I said, were  
12 out of the Towers Watson report. And so that's just  
13 taking those numbers, which we're not necessarily  
14 saying we agree with and we're saying actually we  
15 think are probably worse. But if we look at why the  
16 Towers Watson report may not have arrived at the right  
17 conclusions to its model, there are some things that  
18 we believe that they should have done and didn't. As  
19 I mentioned before, Towers Watson tested cash as its  
20 model and did not test capital requirements. We think  
21 that that would have been the norm, to test more than  
22 simply one model.

23 They also failed to perform stress  
24 testing, preferred stress testing and sensitivity  
25 tests. And this is a somewhat larger conceptual

1 issue, which is it carries to what it is they're  
2 looking for. And again, this goes back to the  
3 definition of failure that I mentioned in the  
4 beginning. What they were looking for is whether or  
5 not there are assets, one dollar meaning there are  
6 assets. They weren't looking at, at what point is  
7 this beginning to fail? What's causing it to fail?  
8 What are the points at which we need to really look  
9 at, because they will be problems in the future, or at  
10 least the most likely problem in the future?

11           And by failing to perform these types of  
12 tests, they can tell them that they simply don't know.  
13 They don't know either. If they do know, they haven't  
14 disclosed it. And so we think that the failure on  
15 Towers Watson's part to perform these types of tests  
16 leaves a big gap. And as the Department can see,  
17 we're trying to figure out the answers to these  
18 questions because we think it would be something  
19 necessary for you to have access to look at.

20           The Towers Watson report also does not  
21 test or identify the company action level for the  
22 runoff companies. You saw a slide before that's based  
23 on what we've gleaned from the Towers Watson numbers  
24 to get what we put together using those numbers. And  
25 we think, as I went through before, that that triggers

1 we prefer regulatory involvement essentially on day  
2 one, exactly from day one.

3           And this falls as part of what we would  
4 consider to be the industry standards for figuring out  
5 what would really be the situation with these runoff  
6 companies, what would be their ability to succeed and  
7 for how long. The industry standards, IRMA and ORSA,  
8 do call for multiple forms of modeling. And here we  
9 have essentially a single form of modeling. And as we  
10 understand it based on the report, without having  
11 access to information underlying the report, it was  
12 performed on just take the low, central and high. And  
13 they just took the central and used that to do the  
14 stochastic modeling. And that was performed on just  
15 the lognormal slope, if you will.

16           And so they took one set of information,  
17 and that's what they ran through the software 10,000  
18 times. And again, software performs these tests. And  
19 so while they may have performed 10,000 different  
20 scenarios, it's based on one set of inputs. And your  
21 testing's only going to be as good as your inputs. I  
22 mean, if you only put in one set of inputs, then that  
23 necessarily drives the results on those 10,000  
24 scenarios.

25           And we think it would have been much

1 more prudent, if not necessary, to perhaps try some  
2 different inputs to find out what might cause major  
3 changes since the inputs are based on the assumptions  
4 that we've been hearing about today, in that a number  
5 of policyholders have expressed real concern today,  
6 because a number of those assumptions have been drawn  
7 in OneBeacon's favor. They're not necessarily the  
8 type of assumptions that we would draw, particularly  
9 because we're dealing with here the asbestos and  
10 environmental type of liability where no one is  
11 sitting here saying it's very easy to predict and you  
12 don't have to worry; you can just go with your one set  
13 of assumptions and not worry about if your modeling is  
14 going to come out okay. We're hearing various  
15 different people say that's not the case. These are  
16 difficult to do. There are no rote assumptions. You  
17 have to rely on the historical data, but after all,  
18 you're making projections. So why wouldn't you want  
19 to try to run as many different models as you can  
20 reasonably perceive in the time to look at? Here we  
21 just have one and we think that's insufficient.

22                   And we're going over some of the  
23 assumptions, but Towers Watson in RRC actually  
24 identified them for you. They say there are what we  
25 refer to as knowns, unknowns. Basically they know,

1 they don't know the answers to these and so they're  
2 putting caveats in their report and highlighting that  
3 they haven't been able to figure out. And while we're  
4 trying to project these, maybe that's another reason  
5 why we need to have more information and perhaps more  
6 stochastic modeling that takes into account the fact  
7 that the assumptions for these unknowns aren't  
8 necessarily going to be just one answer.

9                   And so we have this set out for you,  
10 some of the different statements from the RRC ---  
11 FDRCS report which is the stochastic modeling report.  
12 And Towers excluded outliers from this data. I mean,  
13 the failure rate may actually be higher than the 11.7  
14 percent. So these things actually matter. These  
15 aren't just assumptions that get thrown into so many  
16 different things that it gets evened out. The risks  
17 created by such missing information include that the  
18 models used are not appropriate modelings. That seems  
19 like a pretty big problem. They fail to include  
20 modeling of the variability from lognormal  
21 distribution of claims; I mentioned that before. They  
22 only do the lognormal, which is just one of the  
23 various sets of data they could have looked at.

24                   And we heard earlier about the medical  
25 inflation models, that they may actually vary from

1 historical data, and vary more than indicated by  
2 results of the model. And beyond that, they then took  
3 the medical modeling and offset it with additional  
4 favorable assumptions, including to the interest rates  
5 that may have the effect of underestimating the true  
6 impact claims theory. So we have a number of  
7 different things, some of which are sort of  
8 assumptions on top of assumptions that are heavily in  
9 OneBeacon's favor, and not necessarily made to reach  
10 the most accurate conclusion that can be reached.

11           And here we have on the next slide then  
12 here, that RRC --- Towers make judgmental adjustments  
13 to interest rates, equity returns and A&E defaults,  
14 and all such adjustments were not unreasonable; they  
15 were adding somewhat to the riskiness of the model  
16 results. So you have a single model being run and you  
17 have --- they're filled with assumptions that  
18 essentially make it risky. And we think that, again,  
19 is insufficient and that the Department is entitled to  
20 more information to make this decision. The  
21 policyholders are entitled to more information to find  
22 out what this really will involve.

23           And because the information that the  
24 Towers Watson report is based on has been kept from  
25 us, people like Mr. Kauffman can't perform the types

1 of modeling for his own actuarial report to figure out  
2 what the real answers are. And that goes to the  
3 prejudice to policyholders, which is we can't even  
4 figure this out. We can't --- we don't have the  
5 information we need if we wanted to say fine, we'll do  
6 it. We can't. It's not been provided to us. We've  
7 gone through a Right to Know appeal and gotten as much  
8 information as we could, but OneBeacon and Armor don't  
9 want to provide the information to us.

10           And RRC concludes that the runoff  
11 companies are likely to meet the obligations, but  
12 under considerable stress. Considerable stress is not  
13 defined, and given the problems I've already gone  
14 through with the modeling and the fact that RRC itself  
15 admits that it didn't have the information to really  
16 test or perform any independent analysis on the Towers  
17 Watson report, it's pretty difficult to determine what  
18 it is they mean that the current companies are likely  
19 to meet their obligations, because I'm not sure that  
20 Armor really knows either.

21           And I covered this before, but we'd like  
22 to see the up-to-date reserve data and claim  
23 information used, because why wouldn't you want to  
24 look at the best information you can get? We haven't  
25 heard any real reason why we can't do that.

1           We think all of this is very relevant,  
2 not only under the standards that you have to  
3 consider, but because as policyholders, obviously a  
4 number of different companies have broken up. But  
5 this is something that's very important to them that  
6 these liabilities --- these insurance policies are  
7 very important to them. And we think it's due the  
8 consideration by the Department.

9           Earlier --- actually in your opening  
10 remarks, I believe you had asked about whether or not  
11 people had questions. So if you don't mind Mr.  
12 Kauffman come up with a couple of questions that we  
13 think would be appropriate to have answered as part of  
14 the process.

15                     MR. JOHNSON:

16                     Could you state your name and your  
17 affiliation?

18                     MR. KAUFMAN:

19                     Allan Kauffman, FTI Consulting. Two  
20 items that are really confirming what appears to be  
21 the case from the reports. One is that table one. Is  
22 it done on a cash basis literally as they say, that it  
23 marks the time when cash runs out? That that's  
24 important as Dan has indicated, because that just ---  
25 if it's cash, that's a very misleading --- the effect

1 is very misleading because the talk of cash running  
2 out 30 years could be something that the model --- by  
3 modeling the reserves would have identified as the  
4 technical insolvency after five years, much as the  
5 Home didn't have to wait 20 to 30 years to run out of  
6 cash to know --- the regulators to know that it was  
7 insolvent, that the estimates did that. So number one  
8 is to make sure that that's really what it's doing, in  
9 which case the --- which maybe they could confirm  
10 today, in which case it does serve to be a misleading  
11 table in regard to timing.

12           Secondly, with respect to the model in  
13 capital adequacy, it appears that the model is done as  
14 if zero capital is the cutoff point. So that's to  
15 kind of confirm what might be obvious. And that's  
16 important because both the number of insolvencies and  
17 the timing of insolvencies would depend on the capital  
18 standard. And in terms of what we've said about the  
19 amount of additional capital that's needed, that's key  
20 to say, well, maybe they ought to have at least the  
21 company actual capital.

22           Mr. Johnson, you've indicated maybe the  
23 standard could be different, but it would appear there  
24 ought to be some standard and that standard ought to  
25 be included in the model. That kind of concept seemed

1 to be in the RRC engagement letter, but it appears to  
2 be --- I believe that the simplest beginning question  
3 is, is it really done with zero capital as the  
4 standard for the companies' operations would be cut  
5 in?

6                   Third is the reserves on the opening  
7 balance sheet. It's not clear in some indications  
8 that the --- not from the point of view of the  
9 stochastic modeling, but the point of view of  
10 understanding the basis for the financial statements.  
11 Are those based on Towers Watson's central estimates  
12 or no? It looks as if they're not, in which case we  
13 have a discontinuity, a discrepancy, a difference  
14 between the view of the experts on what the right  
15 starting point and the view of the financial  
16 statement. And that would of course affect the  
17 starting surplus and a view of how the company, from a  
18 financial point of view, apart from the stochastic  
19 level.

20                   And finally, what is the basis for  
21 effectively --- not quite concluding, but suggesting  
22 that a 12 and a half percent --- that a 12 percent  
23 failure rate is good enough? If anything, I know  
24 about good enough from insurance subs they require  
25 much higher safety levels of that risk-based capital,

1 company action level, individual line of business,  
2 risk charges are calibrated to roughly 12 percent.  
3 And that's the company action level for just those  
4 factors, the overall risk-based capital aims for  
5 company action level to be safer than that. So 12  
6 percent for table one is not in any standard I know of  
7 a safe level of --- a safe measure of failure rate.

8                   So the specific question is, is it  
9 really based just on cash? Is there no capital  
10 adequacy testing in the model and what basis, if any,  
11 is there for a presumption created that 12 percent is  
12 safe enough? And I'm sure through counsel we'll have  
13 other questions.

14                   ATTORNEY HEALY:

15                   That's all I have for now.

16                   MR. JOHNSON:

17                   Okay. Well, I think --- just a couple  
18 of points to clear the record always. One is, just so  
19 everybody's aware of --- I think you are but it never  
20 comes out here --- Potomac's already in an action  
21 level today. So just remember, again, my points that  
22 the RBC level does given the commissioner flexibility  
23 and runoff companies that are property and casualty to  
24 be in mandatory control level if it's under the  
25 supervision of the insurance commissioner. And

1 Potomac's already in an action level, so it's not like  
2 this is like newsworthy. So just put ---.

3           Two, again, as I mentioned before, we  
4 mentioned it a number --- is that Century Indemnity  
5 had a lot of conditions in its order. Those  
6 conditions gave us additional oversight. So if you  
7 believe we may be --- again, as I said earlier, we may  
8 be going down a path to approve. Certainly you  
9 believe conditions would help your clients. You  
10 should comment on what conditions would help your  
11 clients for us to consider. That's if we go down that  
12 road.

13           So I bring that up again because Century  
14 Indemnity's class A example of there's like 30, 35  
15 conditions within that order that gives us additional  
16 oversight of the runoff of these --- of Century  
17 Indemnity. And I will say Century Indemnity --- just  
18 to clarify because obviously I was involved in the  
19 transaction. In the letter --- who signed it from  
20 Anderson Kill? This is the Jerry Goldman letter of  
21 July 18. It says, notably the Department has required  
22 Century to be guaranteed by Ace.

23           I just want to make the record clear  
24 here while we're together and you brought it up,  
25 that's not the case. What's in place is an excess of

1 loss treaty of \$800 million between Century Indemnity  
2 and the active United States insurance companies, the  
3 active pool companies in the United States. It is  
4 capped at \$800 million, and then we have the dividend  
5 retention fund of \$50 million. So there is \$850  
6 million, of which some of that \$800 million at this  
7 point, I think 200 --- I just looked at it yesterday.  
8 \$220 million of the \$800 has been used up so far of  
9 the XOL. So just to be clear, Ace has not done a  
10 blanket guarantee.

11 I will say you are correct on the AIG,  
12 that they do have a parental capital maintenance  
13 agreement. That's true. We don't have anything like  
14 that --- we don't have that type of guarantee set up  
15 within the Century Indemnity transaction, just to make  
16 clear.

17 ATTORNEY HEALY:

18 Okay. So just to quickly respond to  
19 your prior comment about Potomac already seen at the  
20 action level, it's OneBeacon and Armor, though, that  
21 have asked for this transaction to be approved by the  
22 Department despite the fact that Potomac is already in  
23 a company action level and it's their burden to  
24 establish why that is something you should approve.

25 MR. JOHNSON:

1                   Okay. Thank you. So we're down to  
2 William. Was anything not covered you may want to  
3 make some remarks?

4                   ATTORNEY GREANEY:

5                   Five minutes.

6                   MR. JOHNSON:

7                   That's fine.

8                   ATTORNEY GREANEY:

9                   Guarantee. I never really met a lawyer  
10 who actually ---.

11                  MR. JOHNSON:

12                  Yeah, right. No, I haven't, so ---.

13                  ATTORNEY GREANEY:

14                  I actually just wanted to respond to a  
15 couple of questions that you had earlier, Mr. Johnson.  
16 One is you asked about other runoffs that failed. I  
17 think your point was to say Home was back in the '90s  
18 when things were done differently and we --- the  
19 regulatory community has learned a lot. And I grant  
20 all that is true. But I mean --- and I --- we can  
21 probably provide you with a more complete list. I  
22 assume you were focused on this side of the Atlantic,  
23 because obviously across ---

24                  MR. JOHNSON:

25                  Yes.

1 ATTORNEY GREANEY:

2 --- the pond ---

3 ATTORNEY DAUBERT:

4 We are.

5 ATTORNEY GREANEY:

6 --- you've got a lot of runoff

7 failures ---

8 MR. JOHNSON:

9 Correct.

10 ATTORNEY GREANEY:

11 --- because they're relatively  
12 unregulated and poorly capitalized. And they're even  
13 more without arrangement. Over here, I mean, a fairly  
14 I think spectacular example of a recent runoff failure  
15 is Kemper. They went into runoff in 2003, 2004 to  
16 most people's considerable surprise. I actually had  
17 an advance awareness that that was coming because of a  
18 particularly meddlesome asbestos account that they had  
19 and wanted to deal with. But most people were quite  
20 surprised by it, and by '05, '06 that beautiful  
21 building they had with the golf course out in Long  
22 Grove that used to be a beehive of activity, there  
23 were 100 people remaining there. And they struggled  
24 around in runoff for the next maybe nine years. And  
25 then in 2013, you know, they went into liquidation,

1 which is going to take literally years to play out.

2           So there are --- another impending,  
3 unfortunately, runoff casualty is probably going to be  
4 Arrowood. And to be fair to the Delaware Insurance  
5 Department, he didn't have a whole lot of leverage,  
6 because there you had a very different situation. You  
7 had a UK parent company that basically got sick and  
8 tired of dealing with the U.S. legal system and said,  
9 we're getting out of the United States, not just GL,  
10 but everything. We're out of here. And when you  
11 don't have a parent organization that's committed to  
12 the U.S. market, no regulator can insist on the sun,  
13 the moon and the stars.

14           So I think the Delaware Department did  
15 about the best it could by insisting that they forgive  
16 indebtedness to the runoff entities. And I think it  
17 was close to a \$300 million capital infusion,  
18 submitting the jurisdiction and establishing a claims  
19 monitor. That being said, if you take a look at the  
20 capital debasement that's occurred since 2006 with  
21 Arrowood, it's very difficult to look at that entity  
22 and think that it's really long for this world. It's  
23 pretty much limping along.

24           And I'd also point out that the damage  
25 --- you also asked another question, why is the status

1 quo better? On the ground level, the damage that is  
2 done by runoff entities is very significant. I cannot  
3 tell you how many times I have negotiated coverage in  
4 place arrangements, both in and out of litigation,  
5 with a bunch of insurers to resolve asbestos claims on  
6 a long term prospective basis with everybody picking  
7 up a share, including the policyholder, just to get it  
8 done, just to get it done, only to have Arrowood and  
9 --- or Kemper come in at the last minute and say, we  
10 don't do that anymore, we don't do coverage in place  
11 arrangements. We want to buy out on the cheap, cents  
12 on the dollar or we're not going to --- we're just  
13 going to throw a monkey wrench in the whole gear.  
14 Those of us who have dealt with runoff companies, they  
15 see that every day.

16                   And you mentioned Travelers getting  
17 hammered in the press. But let's talk about  
18 Travelers. That's a good example of an active  
19 underwriter committed to the U.S. market that  
20 aggressively managed and controlled it's A&E exposure  
21 for that very reason. They input Travelers Indemnity  
22 in their runoff. Hartford, they set up the Heritage  
23 Group, but they didn't put Hartford Accident and  
24 Indemnity into runoff. Why? Because they are  
25 committed to the U.S. market, the property casualty

1 side of the market. They bit the bullet, they  
2 repeatedly raised their reserves and increased them  
3 over time. They aggressively did commutations for  
4 fair value, they aggressively entered into coverage in  
5 place arrangements.

6                   And I have no brief for Travelers and  
7 Hartford. I litigate against them all the time. But  
8 there's a huge difference in the way they behave as  
9 active ongoing underwriters and what a runoff entity  
10 does, which they don't --- they don't proactively work  
11 to really resolve coverage litigation. They  
12 effectively invite or engender coverage litigation  
13 because it puts things on hold for a long period of  
14 time while they work to commute reinsurance and raise  
15 cash and generate investment returns and do the sort  
16 of things that runoff companies do.

17                   So the problem that Travelers and  
18 Hartford and Liberty have is that as hard as they have  
19 worked to manage and reduce their A&E liability,  
20 they've been hit with third and fourth generation  
21 claims which is all new policies and exposures, which  
22 would put them in difficult straights again. But it's  
23 not like they haven't done a good job of managing  
24 their exposure or been unfair across the board to  
25 policyholders.

1           And in terms of Ace, the --- Ace is an  
2 example of a parent, and you mentioned the controls  
3 that you placed on them, which God knows, those are a  
4 lot better than what's being proposed over here, which  
5 is a walk-away, complete disassociation with the  
6 legacy business. They go in one direction, the runoff  
7 rump operation remains with a thinly capitalized  
8 ownership structure that's not going to infuse any  
9 capital if the actuaries are wrong.

10           And the reason that they're wrong is not  
11 because they're good at --- bad at math. It's because  
12 a lot of what goes into estimating asbestos and mass  
13 tort liabilities has more to do with social science  
14 and human psychology than it does with algorithms. So  
15 if they're wrong, if the mathematicians and actuaries  
16 are wrong, we're left without any source of capital  
17 infusion, meaning you won't get it from OneBeacon  
18 because they'll be long gone. And it's quite clear  
19 from Armor Group's balance sheet that they won't be in  
20 a position to do it.

21           So with the Ace transaction, not only  
22 did we have the dividend retention plan, \$2.5 billion  
23 retroactive reinsurance and \$800 million excess of  
24 loss arrangement that you spoke about, we also had an  
25 insurance company that was concerned about the severe

1 reputational consequences of not permitting Century to  
2 fail. I mean, the same policyholders that buy D&O  
3 coverage or Bermuda form coverage from Ace today, also  
4 bought coverage from I&A and have legacy liabilities.  
5 Ace can't afford to have Century fail.

6           But in the OneBeacon situation, not only  
7 would there be no residual capital infusion protection  
8 in the event that the actuaries got it wrong, but  
9 you'll basically have a group of legacy policyholders  
10 like the ones I represent, P&G, ITT, United  
11 Technologies and others, who don't buy --- buys sort  
12 of middle market specialty coverages that OneBeacon  
13 sees itself as offering in the future.

14           So it's for those reasons that we really  
15 hope --- and I take you --- I take your point that you  
16 want specifics. I think there are some specifics in  
17 the Terrell report. We'd be happy to provide more,  
18 but what I'm --- my clients at least are looking for  
19 is some residual protections. Because we just don't  
20 share the optimism fundamentally that Towers Watson  
21 does. And RRC is not optimistic; let's call it like  
22 it is. They're --- they said, well, it's standard  
23 actuarial methodology, but I mean, they're not  
24 standing behind this report as a completely accurate  
25 projection of what we're going to see in the future.

1 So we're just looking for residual protections.

2 That's the long and short of it. Thank you.

3 MR. JOHNSON:

4 Thank you.

5 ATTORNEY DAUBERT:

6 Thank you.

7 MR. JOHNSON:

8 We're going to take a 15-minute break so  
9 we can huddle and determine whether we want to ask  
10 some questions before we go through the rest of the  
11 agenda. So we'll be back at 3:10.

12 SHORT BREAK TAKEN

13 MR. JOHNSON:

14 We'll get started again. I only really  
15 have one question, though I have some additional  
16 comments. And I think Brad, you want to come up just  
17 for ---? And certainly as we talked about, you can  
18 supplement this with additional information subsequent  
19 to this. But I don't remember if there was something  
20 in the Form A or not --- you had talked about in your  
21 remarks that you believe you're going to have an  
22 expense savings in running this compared to the  
23 expense load that OneBeacon currently has.

24 MR. HUNTINGTON:

25 Correct.

1                   MR. JOHNSON:

2                   Have you done any analytics on that to  
3 demonstrate? Has that been put into the Form A  
4 Filing? How do you determine that you think you can  
5 run it off at a less expense load than currently  
6 OneBeacon is doing?

7                   MR. HUNTINGTON:

8                   We have done our own internal analytics  
9 as part of the negotiation of the transaction. We  
10 have not disclosed what we think those savings are to  
11 either OneBeacon or to the Department. I would be  
12 happy to put some numbers around historical cost  
13 savings in other transactions that we participated. I  
14 think I'd be hesitant to put it into this transaction  
15 in that they're speculative and just an assumption  
16 about the efficiencies that can be obtained by putting  
17 an existing operation together with another operation.

18                   Obviously when you have claims people, a  
19 claims examiner can handle more than one file, so if  
20 they have X files already and you add another ten to  
21 their file load, then it doesn't cost you  
22 incrementally more money. So there are some natural  
23 cost savings by putting together organizations. And  
24 we can provide examples ---.

25                   ATTORNEY DAUBERT:

1 I think we're asking for specifics of  
2 where your claims of cost savings are coming from.

3 MR. HUNTINGTON:

4 It can be significant. We'll put some  
5 rough numbers that I think will help the Department  
6 get an understanding of the potential.

7 MR. JOHNSON:

8 Okay. If you would do so.

9 MR. HUNTINGTON:

10 Okay.

11 MR. JOHNSON:

12 Okay. That's it. Thank you.

13 MR. HUNTINGTON:

14 Thank you.

15 MR. JOHNSON:

16 Why we decided not to ask anymore  
17 additional questions is we believe that today the  
18 public has put a lot of questions and comments on the  
19 record, that I don't think we have the time today  
20 orally off the cuff, so to speak, to get into kind of  
21 responses --- the kind of responses as a regulator I'd  
22 like to see, real analytics around a response. So  
23 that's why I'm not going to ask any more questions.

24 But what I'm going to task again, as I  
25 did at the beginning, that all the comments of the ---

1 of the public commenters need to be appropriately  
2 addressed by the Applicant if it's a question  
3 concerning the Applicant, or the Seller, if it's  
4 concerning the Seller. We will have --- we are  
5 targeting to have the transcript of this up on our  
6 website next Thursday, the 31st of July. I'm sure  
7 everybody took a lot of notes also, but you'll have  
8 the transcript to review and go through.

9           But really, there's a lot of information  
10 that the public has brought forth today that really  
11 needs specific kind of thoughtful, analytical response  
12 to from either the Applicant and/or the Seller. And  
13 certainly, if the public has even more questions or  
14 thoughts, there'll be more time, as I'll get into in  
15 my closing remarks, to add to the record about this  
16 transaction in the public comment period that I'll get  
17 into shortly when we close.

18           So just --- I don't think --- otherwise  
19 I think any questions that we ask today would be not  
20 really effective answers, because this was a lot of  
21 very detailed kind of comments and questions from the  
22 presenters today, from the public presenters.

23           So with that, I will give an opportunity  
24 if the commenters, any commenters want to add any  
25 additional comments. Very short, but you've heard

1 from other commenters. I'll give you your opportunity  
2 if you have a few minutes that you want to add  
3 anything else to the record before we close down the  
4 hearing.

5 ATTORNEY STOCKMAN:

6 Mr. Johnson, I just have about one  
7 minute's worth of comments. Should I just stand here  
8 and deliver them?

9 MR. JOHNSON:

10 Sure.

11 ATTORNEY STOCKMAN:

12 And they really are addressed to the  
13 point you raised in response to my comments, which is  
14 an important one, which is that this case turns on  
15 uncertainty. But it's not so much as to whether  
16 they're uncertainty. Of course there is. Rather,  
17 it's who should bear the risk of that uncertainty.

18 My clients, who bought broad, general or  
19 umbrella liability coverage, purchased something that  
20 was intentionally designed to give them certainty in  
21 an uncertain world. They paid a sum certain in return  
22 for a promise that Commercial Union companies would  
23 cover unexpected liabilities that happened to be  
24 asserted against them. That quasi-fiduciary nature of  
25 that obligation is why the Department even regulates

1 this sort of stuff in the first place.

2           Now, my clients can't get complete  
3 certainty now. No one can, but we submit that the  
4 risk of that uncertainty should fall upon the insurer  
5 and not upon the policyholder who paid a premium to  
6 shift the risk to a company who is by definition a  
7 professional taker of risks. At a minimum, our  
8 clients deserve better than the chances of success or  
9 failure that appear to be faked into the transaction  
10 as it's now structured.

11           We would ask the Department to ensure  
12 that there's sufficient assets available to give  
13 policyholders what they bought. And we would also ask  
14 the Department to enable policyholders to make their  
15 own calculations as to what that level of assets  
16 should be and to appropriately offer our views to the  
17 Department based on a complete base of knowledge.

18           In making that core determination,  
19 whether the proposed transaction accurately accounts  
20 for the future uncertainty associated with asbestos  
21 and environmental liabilities, our best basis now for  
22 predicting what's likely to happen in the future is of  
23 course what's happened in the past. While it's cliché  
24 to say that those who forget the past are doomed to  
25 repeat it, that cliché like most clichés has a core of

1 truth. And the industry's track record in the context  
2 of asbestos and environmental reserve estimation is  
3 frankly not encouraging.

4           So we would ask the Department to keep  
5 these transactions in --- or concepts in mind in  
6 deciding whether to permit this transaction to move  
7 forward at all, or if it does elect to have the  
8 transaction move forward, in deciding what conditions  
9 are appropriate to protect the policyholders. Thank  
10 you again for the opportunity to speak.

11           MR. JOHNSON:

12           Any other public commenters want to add  
13 anything at this point?

14           Seeing none, does either the Seller or  
15 Applicant want to have any closing remarks at all, or  
16 any of your representatives?

17           MR. MCDONOUGH:

18           I would like --- excuse me. I would  
19 like to make a ---

20           MR. JOHNSON:

21           Sure.

22           MR. MCDONOUGH:

23           --- comment.

24           MR. JOHNSON:

25           Come on up.

1                   MR. MCDONOUGH:

2                   Appreciate the opportunity to make a  
3 closing comment. We certainly look forward to  
4 responding in writing to the comments that we heard  
5 today and related filings that were put out in the  
6 course of the last few days. And I certainly  
7 acknowledge that some of them are thoughtful and  
8 substantive. But I would characterize much of what  
9 we've heard as full of exaggeration and distortion and  
10 conjecture and a number of blatant falsehoods. And  
11 we'll address those in our response.

12                   Having said that, I would also like to  
13 address the basic premise that I think cuts across all  
14 of the policyholders' comments. And that is in the  
15 event this transaction is not approved, the current  
16 group of companies, including both the ongoing and  
17 runoff business combined, will never be capital  
18 constrained. That seems to be the premise. Or put  
19 another way, that the management team of OneBeacon  
20 will always under every circumstance be prepared to  
21 contribute additional capital into the regulated  
22 operating companies if necessary.

23                   I suggest this is a false premise. In  
24 the event the transaction is approved, in the rare  
25 scenarios where the company runs out of assets before

1 it has paid its last dollar of claims, it is not  
2 likely to reach that eventuality for 20 or 30 years or  
3 more, as demonstrated in the stochastic modeling  
4 completed by Towers Watson. During that period, the  
5 capital needs of OneBeacon's ongoing business will be  
6 subject to exposures and business contingencies that  
7 cannot be predicted with any degree of certainty.

8           We submit that assuming the transaction  
9 is not approved, whether OneBeacon will have the  
10 resources or the intention to add additional capital  
11 to a runoff subsidiary 20 or 30 years from now  
12 provides less certainty to policyholders than the  
13 certainty provided by the significant asset transfer  
14 and the dedicated management provided for in the  
15 proposed transaction. While in the absence of this  
16 transaction it would certainly continue to be the  
17 intention of the current OneBeacon management team to  
18 manage the business in such a way that capital never  
19 becomes an issue, that was also the intention of the  
20 management team of every insurance company in the past  
21 that has gone from a viable ongoing enterprise to a  
22 company headed toward insolvency, and we all know that  
23 could happen very quickly.

24           In addition, the current OneBeacon  
25 management team is not likely to be in place 20 years

1 from now. My point is that even with no transaction,  
2 there is simply no guarantee of solvency indefinitely,  
3 or in this case, over a 20 to 30-year period or to  
4 ultimately a 70-year period that takes us to the  
5 ultimate resolution of the claims, as the risk factors  
6 in the 10K of every public property casualty insurance  
7 company very clearly spells out.

8           If on the other hand the transaction is  
9 approved, what we believe is clear from the Towers  
10 Watson stochastic modeling is that the transferring  
11 companies are adequately and appropriately capitalized  
12 in the context of a very wide distribution of  
13 potential outcomes, and they would immunized going  
14 forward from any of the risks of the ongoing company,  
15 both those relating to the current business and those  
16 relating to any business that they undertake in the  
17 future. In addition, the proposed transaction has the  
18 benefits associated with transferring the ownership  
19 and management responsibilities of the runoff  
20 liabilities to dedicated runoff specialists.

21           Thank you again for the opportunity to  
22 speak.

23           MR. JOHNSON:

24           Thank you. Is there anybody, since this  
25 is a public informational hearing, that has anything

1 else to say before we close it out?

2           Okay. On behalf of the Department, I'd  
3 like to thank everybody for their participation here  
4 today. I think it was very productive. As I noted  
5 earlier, a transcript of this hearing will be posted  
6 on the Department website when it becomes available.  
7 As I said earlier, we hope by next Thursday.

8           Additionally, as I mentioned earlier,  
9 the Applicant will be required to file written  
10 responses to all questions and comments posed at  
11 today's hearing. Such responses will be posted on the  
12 Department's website. The public comment period will  
13 be reopened immediately and will close 30 days after  
14 the transcript is made available and after all  
15 questions and responses are compiled. The official  
16 close of the comment period will be noticed in the  
17 Pennsylvania Bulletin.

18           Again, thank you, everybody, for coming  
19 and your comments today. We are adjourned.
